Application Development

CS6004NI

Course Work 1

Submitted By: Sajan Gurung
London Met ID: Enter ID Here

Submitted To: Ishwor Sapkota
Module Leader

Component Grade and Comments	
A. Implementation of Application	
User Interface and proper controls used for designing	missing controls in the interface
Manual data entry or import from csv	not properly saved or imported data
Data Validation	missing most of the validation
Enrollment Report & weekly report in tabular format	very poorly executed reports and data not shown accurately
Course wise enrollment report & Chart display	Very poorly designed and only contains one report format with in appropriate data
Algorithm used for sorting & proper sorting of data	Sorting is implemented for not function properly
B. Documentation	
User Manual for running the application	User Manual is below average. Is textual only.

Application architecture & description of the classes ad methods sued	architecture is included and satisfactory descriptoin of class and methods used.
Flow chart, algoriathms and data sctructures used	average work with very limited explanation and missing diagramatic representation.
Reflective essay	Very poorly written

C. Programming Style

Clarity of code,Popper Naming convention & comments	very poorly written code and no comments at all
System Usability	very poorly developed application

Overall Grade:	C	C
-----------------------	----------	----------

Overall Comment:

Code should be self explainable with less comments. Need some proper naming of the component and require to add comments on required area.
In overall the code is working and all the functionality seems working and system can be used

Module Code & Module Title

1. Introduction

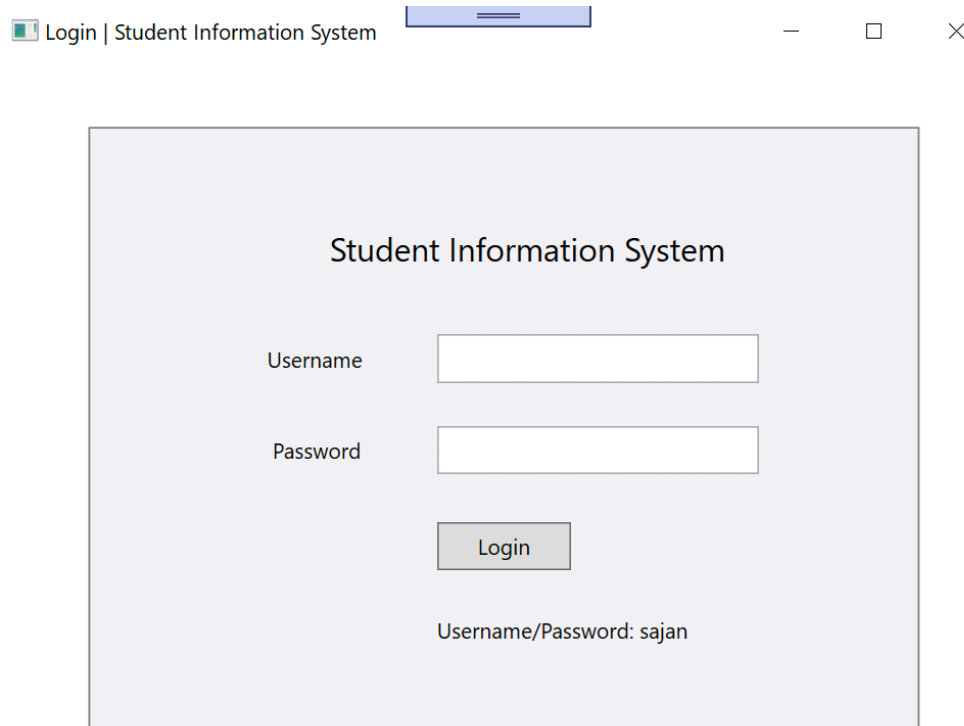

This is our 1st coursework of Application Development where we have to design and implement a system for storing student's information. The name of the application is '**Student Information System**'. The language used to develop the system is C#.

The app is developed in WPF. The user needs to login first in order to use other functionalities. The default username/password is 'sajan'. In the system, the user can enrol students by entering their details. The student ID is automatically generated. The data is then saved in a CSV file. Similarly, the user can import students details from a CSV file. The user can sort the student details by their name or registration date. Similarly, there are a report and a chart that displays the total number of students enrolled in a course.

Data structures like array and list are used in the application. The course details are prefilled. For the chart, live chart package is used. This application is developed specially to keep the track of student's details, program enrolled and registration date. It will be helpful for any educational institutes. By using the system, they can track the students details easily and it is very easy to use.

2. User Guide

2.1 Login

The screenshot shows a web browser window titled "Login | Student Information System". The main content area has a light blue background and contains the following elements:

- The title "Student Information System" centered at the top.
- A "Username" label followed by a text input field.
- A "Password" label followed by a text input field.
- A "Login" button below the password field.
- A feedback message "Username/Password: sajan" displayed below the login button.

Figure 1: Login Panel

In order to use the system, the user needs to login first. The username/password is 'sajan'. The username and password fields cannot be empty and they should enter the correct login credentials in order to access the other features.

Figure 2: Login Field Error

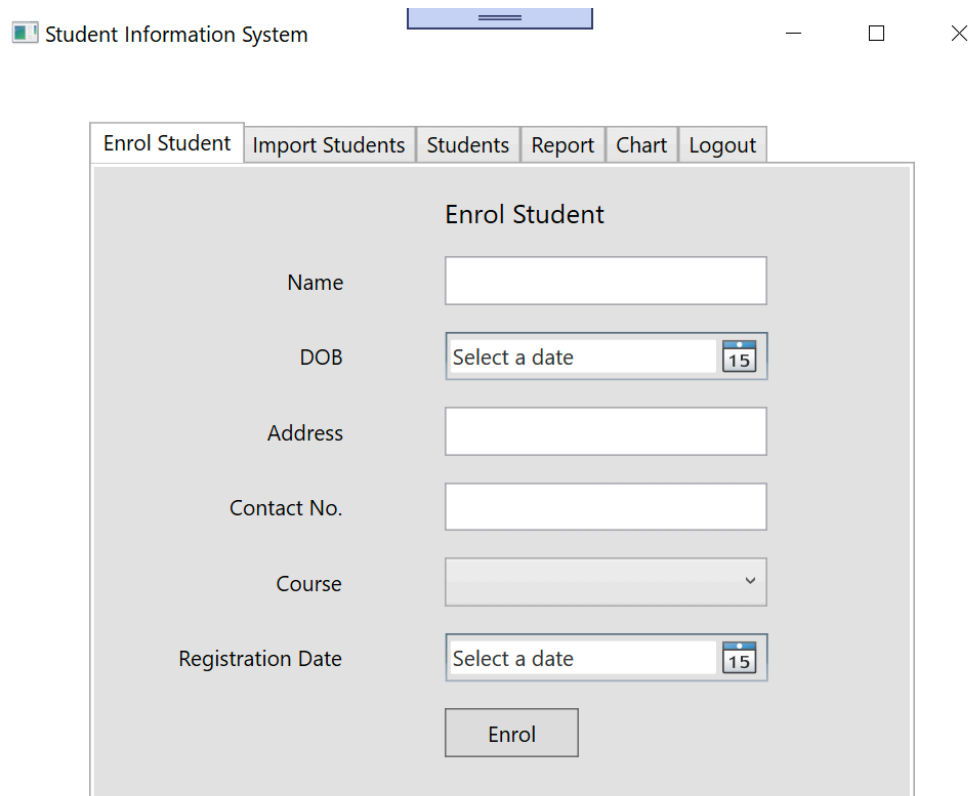

Figure 3: Invalid Username/Password

2.2 Enrol Student

The screenshot shows a web application window titled "Student Information System". Inside the window, there is a navigation bar with tabs: "Enrol Student", "Import Students", "Students", "Report", "Chart", and "Logout". The "Enrol Student" tab is selected. Below the navigation bar, the main content area is titled "Enrol Student". It contains a form with the following fields:

- Name: A text input field.
- DOB: A date picker with the text "Select a date" and a calendar icon showing the date 15.
- Address: A text input field.
- Contact No.: A text input field.
- Course: A dropdown menu with a downward arrow.
- Registration Date: A date picker with the text "Select a date" and a calendar icon showing the date 15.

At the bottom of the form is an "Enrol" button.

Figure 4: Enrol Student Panel

The user should fill the enrol form in order to enrol a student in the system. The details contain student name, dob, address, contact no., enrolled course and registration date. None of the fields should be empty. The data is then saved in a CSV file 'students.csv'.

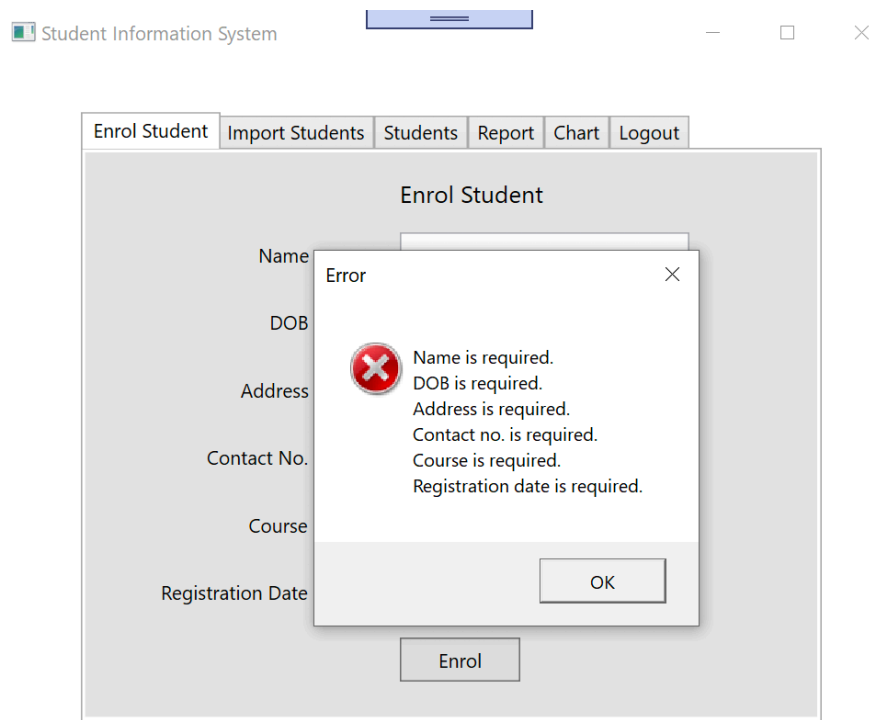

Figure 5: Enrol Student Field Error

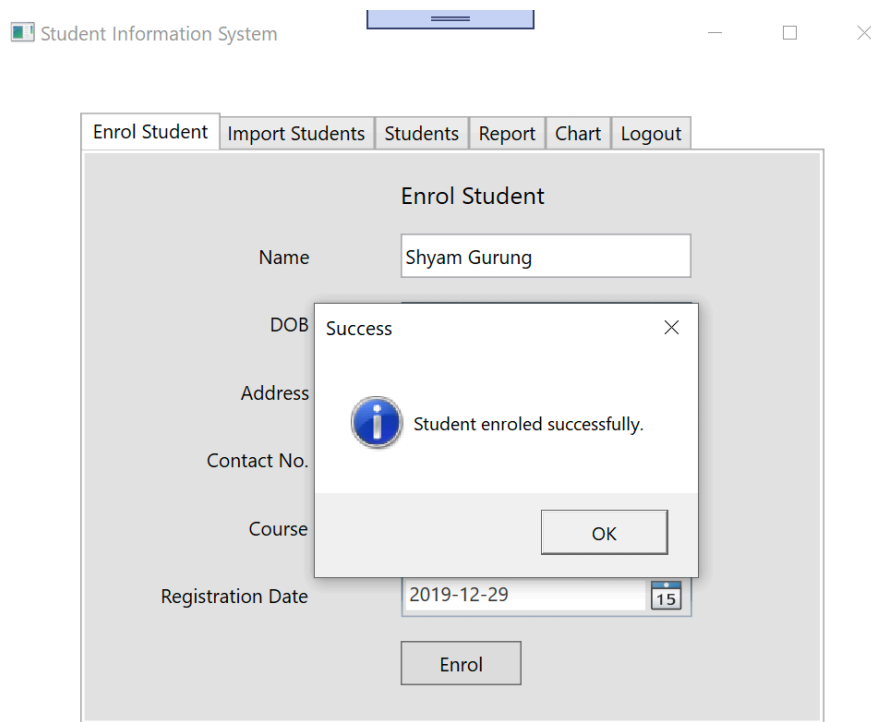

Figure 6: Enrol Student Success

2.3 Import Student

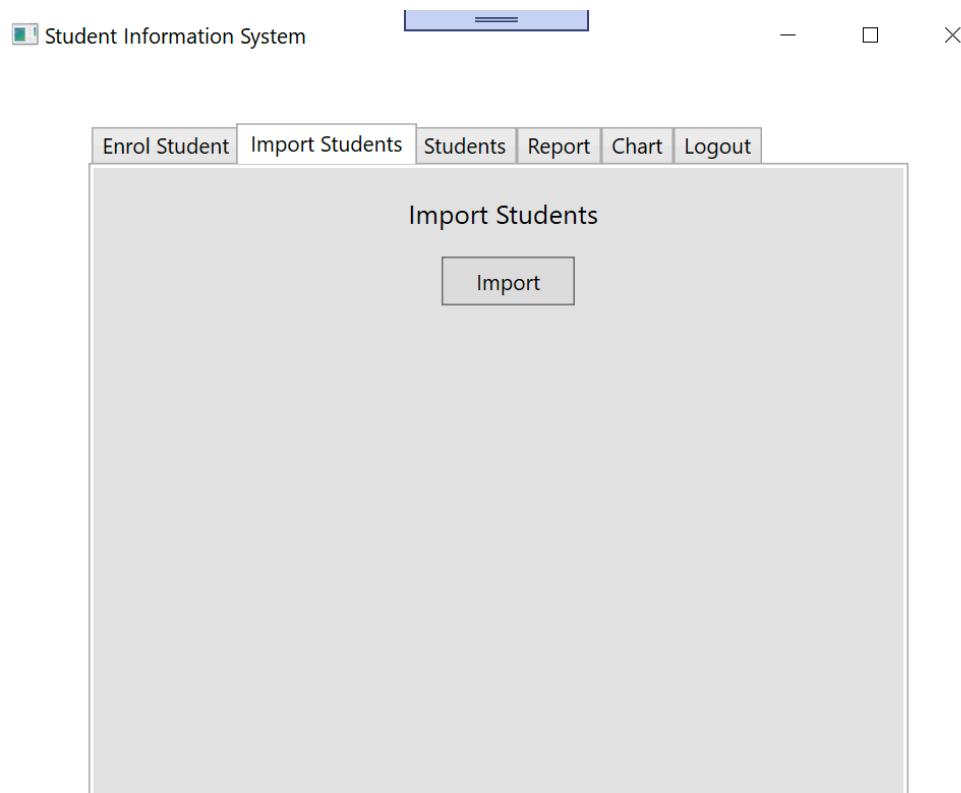

Figure 7: Import Students Panel

The user should click on the 'Import' button to import student details. Then, a window appears to select a file. Then, the data is saved in a CSV file 'students.csv'. The user can only choose CSV to import. A demo CSV file is added in the base application folder. We can use the file for testing.

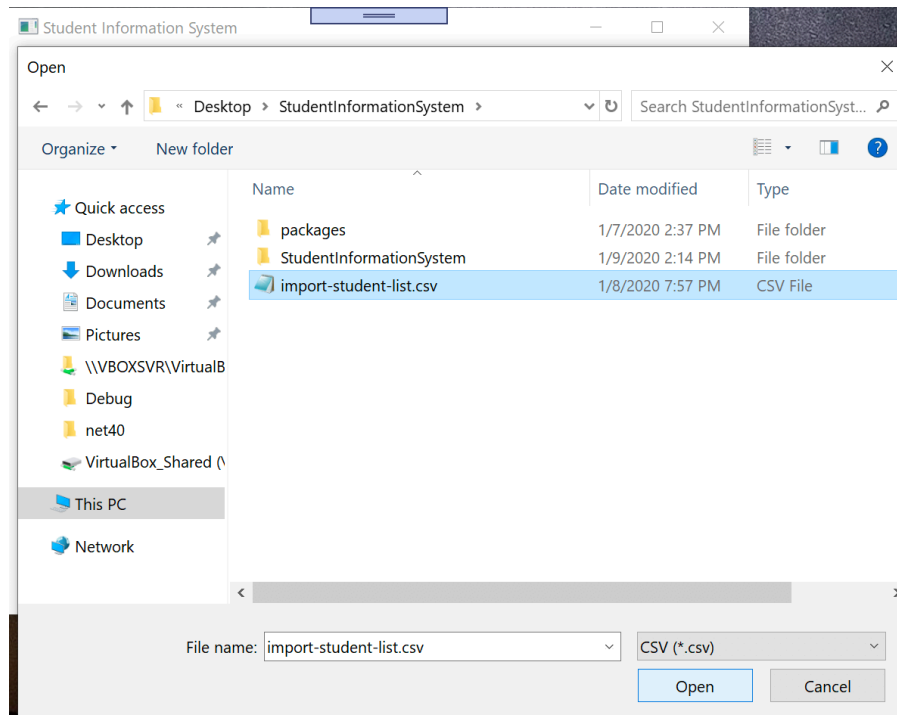

Figure 8: Select File Window

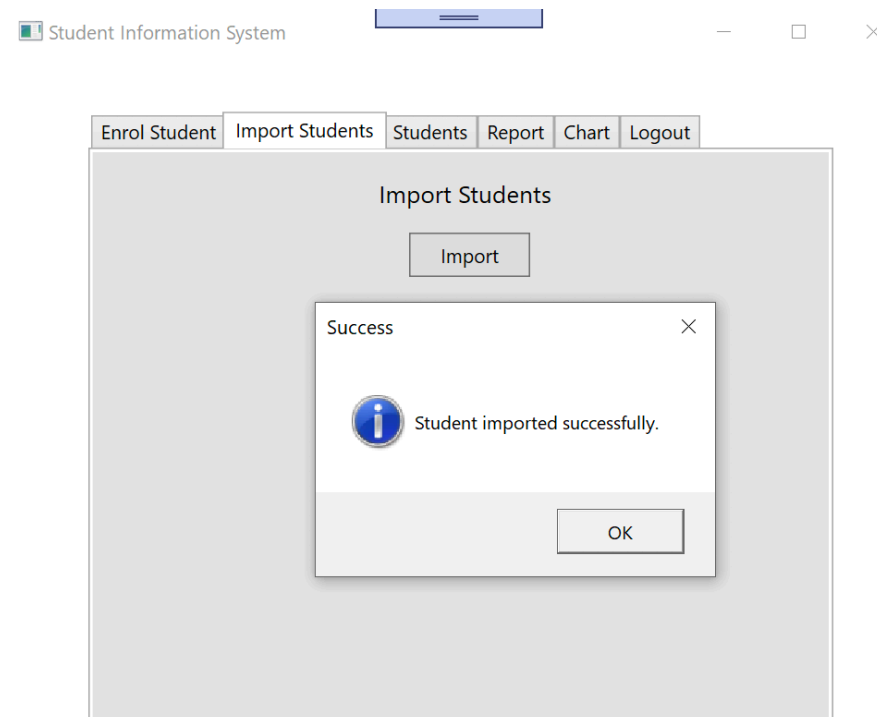

Figure 9: Import Students Success

2.4 Students

Figure 10: Students Panel

Here, we can see the list of students with their details. In order to sort the students by name, the user should click on 'Sort by Name' button. First, the students are sorted by name in ascending order and on clicking again, it sorts by name in descending order. Similarly, on clicking 'Sort by Registration Date', the students are sorted by registration date in ascending order first. If we click it again, the list is sorted in descending order. This process goes on for both the button.

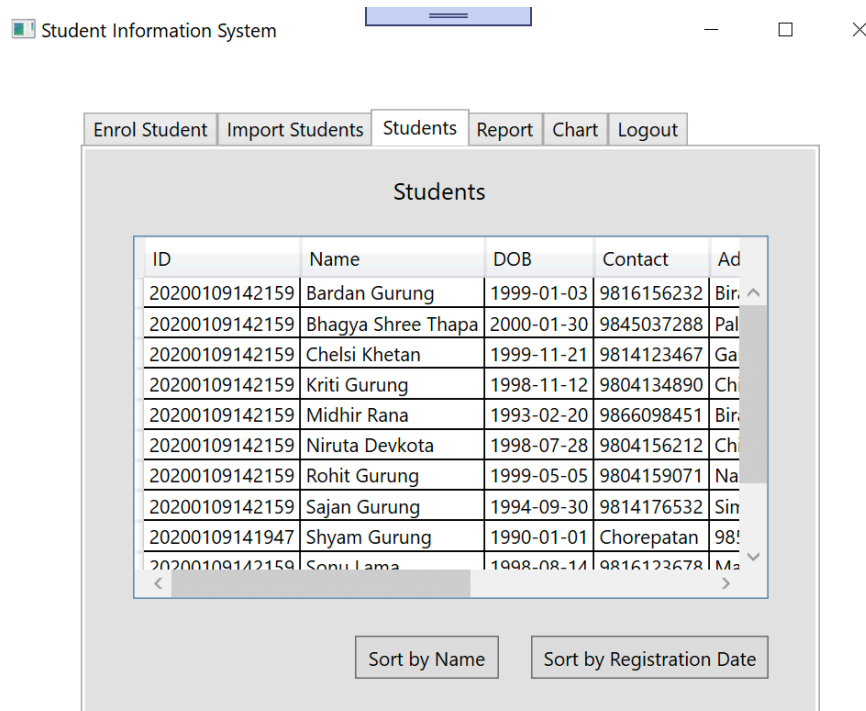

Figure 11: Sort Students by Name in Ascending Order

Figure 12: Sort Students by Name in Descending Order

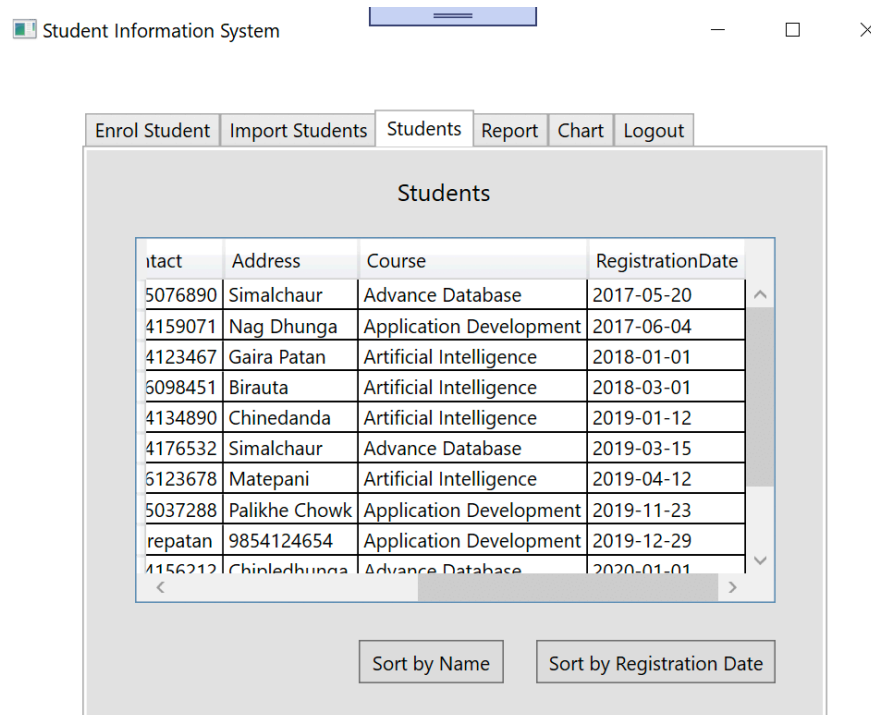

Figure 13: Sort Students by Registration Date in Ascending Order

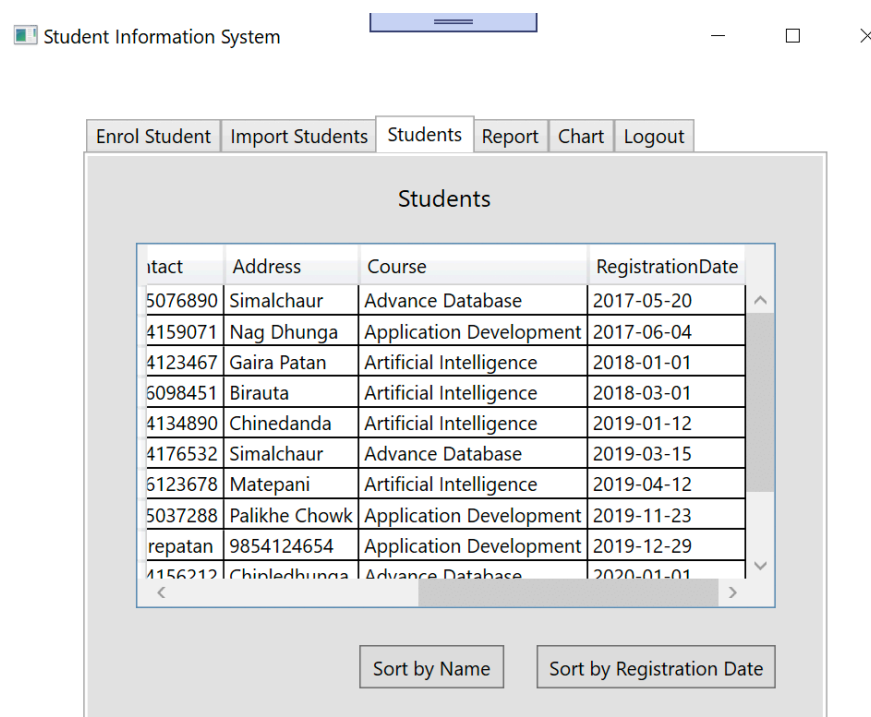

Figure 14: Sort Students by Registration Date in Descending Order

2.5 Report

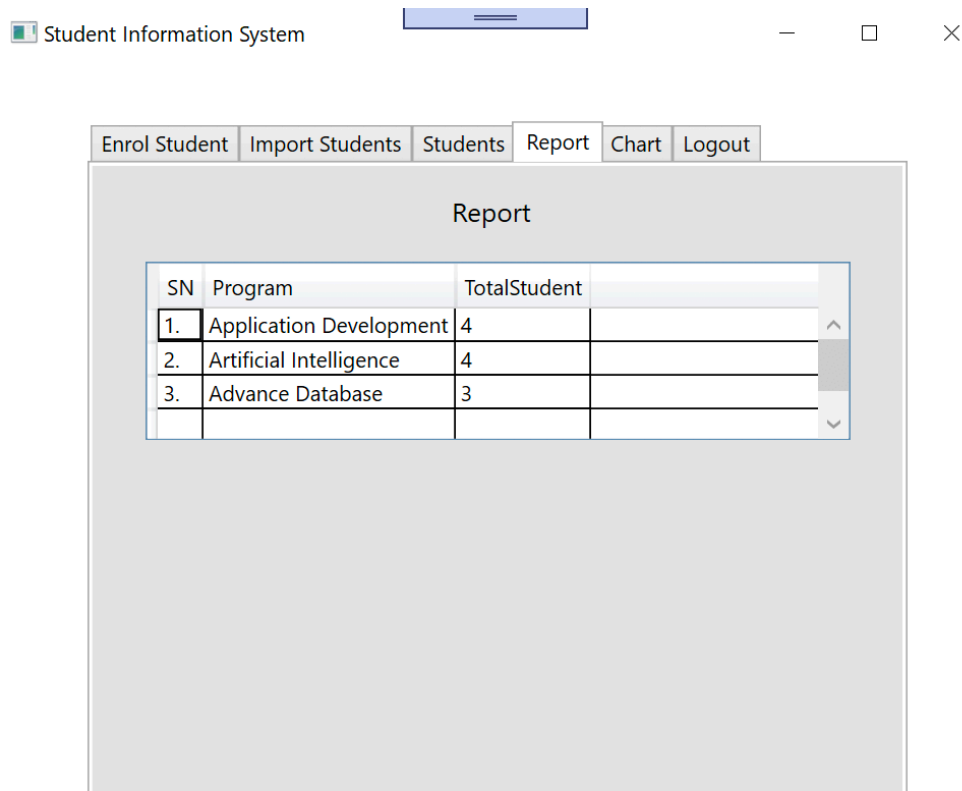

Figure 15: Report Panel

In the report tab, the total no. of students enrolled in each course are shown in tabular form.

2.6 Chart

Figure 16: Chart Panel

In the report tab, the total no. of students enrolled in each course are shown in a pie chart. Live chart is used here.

2.7 Logout

By clicking on the 'logout' tab, the user logs out from the system and the login panel is shown.

3. Classes

3.1 LoginWindow

It is my own class which handles the login function. The class contains two class variables 'err' and 'errMsg'.

Figure 17: Class Diagram of LoginWindow

3.2 MainWindow

It is my own class which handles the other functions like enrol students, import students, student lists, report and chart. The class contains four class variables 'err', 'errMsg', 'sortName' and 'sortRegistrationDate'.

Figure 18: Class Diagram of MainWindow

3.3 Course

It is my own class for storing course details. It has three properties: 'SN', 'Program' and 'TotalStudent'.

Figure 19: Class Diagram of Course

3.4 Student

It is my own class for storing student details. It has seven properties: 'SN', 'Name', 'DOB', 'Contact', 'Address', 'Course' and 'RegistrationDate'.

Figure 20: Class Diagram of Student Class

4. Methods

4.1 Class: LoginWindow

4.1.1 LoginWindow()

It is the constructor of the 'LoginWindow' class.

4.1.2 btnLogin_Click(object sender, RoutedEventArgs e)

It handles the user login function. The default username/password is 'sajan'. After entering the correct credentials, it redirects to 'MainWindow'.

4.2 Class: MainWindow

4.2.1 MainWindow()

It is the constructor of the 'MainWindow' class.

4.2.2 btnEnrol_Click(object sender, RoutedEventArgs e)

It handles the student enrol function. The user enters the student's details and the enrolled date are saved in a CSV file named 'students.csv'.

4.2.3 GetTimestamp()

It returns the timestamp of the current date.

4.2.4 btnImport_Click(object sender, RoutedEventArgs e)

It handles the students import function. The user imports the student's details from a CSV file and the enrolled date are saved in a CSV file named 'students.csv'.

4.2.5 TabControl_SelectionChanged(object sender, SelectionChangedEventArgs e)

It handles the tabs click function.

4.2.6 GenerateStudents()

It displays the list of students enrolled with their details from a CSV file 'students.csv'.

4.2.7 btnSortName_Click(object sender, RoutedEventArgs e)

It sorts the student name in ascending or descending order.

4.2.8 btnSortRegistrationDate_Click(object sender, RoutedEventArgs e)

It sorts the student registration date in ascending or descending order.

4.2.9 GenerateReport()

It displays the list of courses and the total no. of students enrolled in the course in tabular form.

4.2.10 GenerateChart()

It displays the list of courses and the total no. of students enrolled in the course in pie chart.

4.2.11 Chart_OnDataClick(object sender, ChartPoint chartpoint)

It is the method of live chart that handles the pie chart.

5. Journal

Live Chart is a simple, flexible, interactive & powerful data visualization for .Net. It is open source and free (Live Charts, n.d.). It has been used to make the chart to show the total no. of students enrolled in each course.

Figure 21: Implementation of Live Charts

6. Data Structures

6.1 Array

An array is a group of like-typed variables that are referred to by a common name. And each data item is called an element of the array. The data types of the elements may be any valid data type like char, int, float, etc. and the elements are stored in a contiguous location. Length of the array specifies the number of elements present in the array. In C# the allocation of memory for the arrays is done dynamically. And arrays are kind of objects, therefore it is easy to find their size using the predefined functions. The variables in the array are ordered and each has an index beginning from 0. Arrays in C# work differently than they do in C/C++ (Geeks for Geeks, n.d.).

Figure 22: Array (Geeks for Geeks, n.d.)

6.2 List

A list is an object which holds variables in a specific order. The type of variable that the list can store is defined using the generic syntax. Here is an example of defining a list called numbers which holds integers (Lear CS, n.d.).

```
List<int> numbers = new List<int>();
```

The difference between a list and an array is that lists are dynamic sized, while arrays have a fixed size. When you do not know the amount of variables your array should hold, use a list instead.

Once the list is initialized, we can begin inserting numbers into the list.

```
List<int> numbers = new List<int>();
```

```
numbers.Add(1);
```

```
numbers.Add(2);
```

```
numbers.Add(3);
```

7. Flowchart

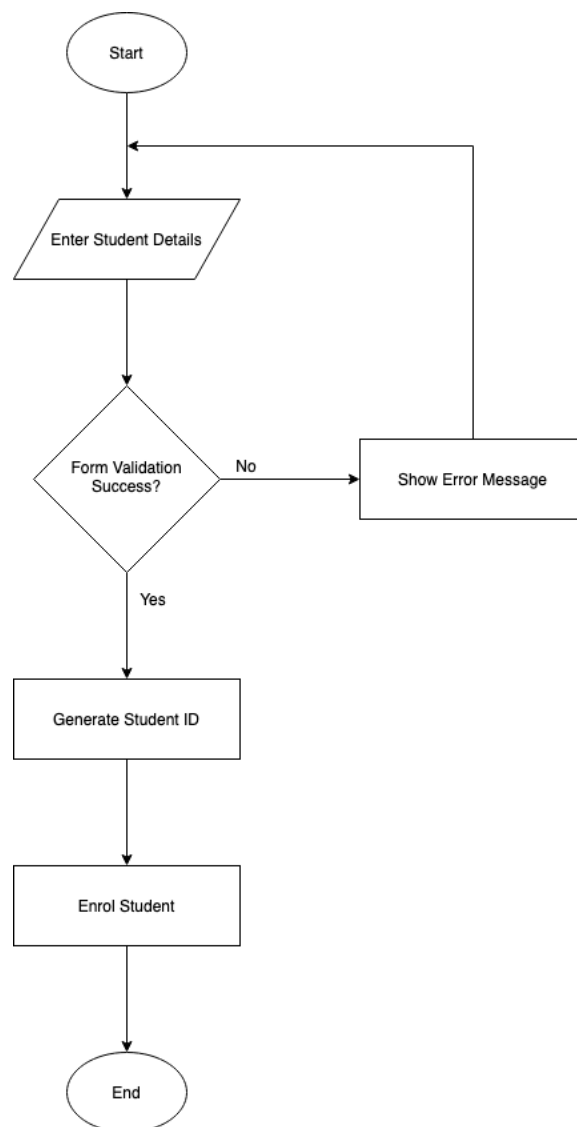

Figure 23: Flow Chart for Enrolling Student

8. Sorting Algorithm

In order to sort the student list by name and registration date, I have used LINQ sorting method. In LINQ, sorting operators are used to rearrange the given sequence in ascending or descending order based on one or more attributes. There are 5 different types of sorting operators are available in LINQ: `OrderBy`, `OrderByDescending`, `ThenBy`, `ThenByDescending` and `Reverse`. I have used only 'OrderBy' and 'OrderByDescending' sorting.

```
/**
 * Sort students by name.
 */
1 reference
private void btnSortName_Click(object sender, RoutedEventArgs e)
{
    List<Student> students = new List<Student>();
    students = (List<Student>)gridStudents.ItemsSource;

    if (sortName.Equals("asc"))
    {
        List<Student> sortedList = students.OrderBy(o => o.Name).ToList();
        gridStudents.ItemsSource = sortedList;
        sortName = "desc";
    }
    else
    {
        List<Student> sortedList = students.OrderByDescending(o => o.Name).ToList();
        gridStudents.ItemsSource = sortedList;
        sortName = "asc";
    }
}

/**
 * Sort students by registration date.
 */
1 reference
private void btnSortRegistrationDate_Click(object sender, RoutedEventArgs e)
{
    List<Student> students = new List<Student>();
    students = (List<Student>)gridStudents.ItemsSource;

    if (sortRegistrationDate.Equals("asc"))
    {
        List<Student> sortedList = students.OrderBy(o => o.RegistrationDate).ToList();
        gridStudents.ItemsSource = sortedList;
        sortRegistrationDate = "desc";
    }
    else
    {
        List<Student> sortedList = students.OrderByDescending(o => o.RegistrationDate).ToList();
        gridStudents.ItemsSource = sortedList;
        sortRegistrationDate = "asc";
    }
}
```

Figure 24: Use of LINQ Sorting

OrderBy

OrderBy operator is used to rearranging the elements of the given sequence in ascending order. This operator by default converts the order of the given sequence in ascending order. There is no need to add an extra ascending condition in the query expression means ascending keyword is optional. We can also use the descending keyword to change the order of the given sequence in descending order (Geeks for Geeks, n.d.).

OrderByDescending

OrderByDescending operator is used to rearranging the elements of the given sequence in descending order. It does not support query syntax in C# and VB.Net. It only supports method syntax. If we want to rearrange or sort the elements of the given sequence or collection in descending order in query syntax, then we have to use descending keyword (Geeks fot Geeks, n.d.).

Similarly, in method syntax, we should use OrderByDescending() method to sort the elements of the given sequence or collection. This method is present in both the Queryable and Enumerable class. And the method syntax is supported by both C# and VB.Net languages. The OrderByDescending method sorts the elements of the collection according to a single property, we are not allowed to sort the collection using multiple properties.

9. Learning Reflection

Till the completion of the coursework, I got pretty much familiar with C#. At the beginning of the coursework, I had quite some difficulties regarding the language. It resembles with Java which we have been studying from 1st year but there are some differences. So, it was a little bit harder to cover it but ultimately, I got used to it and now feel much more familiar.

It was easy to use MS Visual Studio as I have been using other IDEs like Android Studio and IntelliJ. The experience was good. Due to the build in templates available, it was very easy and fast to write the code. We could just easily drag and drop the necessary elements.

Regarding the app, at first, it was quite frustrating because I had lots of issues in my code and I was finding solutions day and night. For e.g., while enrolling the students, I tried to save the data in an XML file. I successfully did that using serialization but the problem was the student data was overridden after another enrol. I fixed that issue and when I tried to import those data in data grid using deserialization, it showed error as there were multiple root elements. It was so frustrating. After lots of efforts, I then switched to the idea of saving student's data in CSV rather than XML.

By doing this coursework, I learned many new things. I knew how to download the packages and use them in Visual Studio like I have used the live chart. My knowledge regarding C# has slightly increased and I am very thankful to our module leader and my friends for their help to complete this coursework on time.
