Application Development

CS6004NI

Course Work 1

Submitted By: Shreesha Khadka
London Met ID: Enter ID Here

Submitted To: Ishwor Sapkota
Module Leader

Component Grade and Comments	
A. Implementation of Application	
User Interface and proper controls used for designing	User Interface is complete but not separated and have proper use of controls
Manual data entry or import from csv	not properly saved or imported data
Data Validation	Only basic validation
Enrollment Report & weekly report in tabular format	Any one of the report is missing or not complete
Course wise enrollment report & Chart display	Very poorly designed and only contains one report format with in appropriate data
Algorithm used for sorting & proper sorting of data	Default sorting provided by .net is used
B. Documentation	
User Manual for running the application	User Manual is below average. Is textual only.

Marking Scheme

Application architecture & description of the classes ad methods sued	average work with very limited explanation of the classes and methods used
Flow chart, algorithms and data sctructures used	average work with very limited explanation and missing diagramatic representation.
Reflective essay	Very poorly written

C. Programming Style

Clarity of code,Popper Naming convention & comments	very poorly written code and no comments at all
System Usability	unusable system

Overall Grade:	D+	D+
-----------------------	-----------	-----------

Overall Comment:

Code should be self explainable with less comments. Need some proper naming of the componen and require to add comments on required area.

OK, Good try.

Module Code & Module Title
CS6004NP & Application Development

Assessment Weightage & Type
30% Individual Course Work

3rd Year and 1st Semester

Name: Shreesha Khadka
College ID: NP04CP4A170035
University ID: 17030746

I confirm that I understand my coursework needs to be submitted online via Google Classroom under the relevant module page before the deadline in order for my assignment to be accepted and marked. I am fully aware that late submissions will be treated as non-submission and a marks of zero will be awarded.

1. Introduction

The designed system for our coursework is of Student Information System. This system is developed and have done testing under different circumstances and different criteria. Different functions that the student information system seek are completed by this developed system. It consists of different types of features like adding the student details, importing the csv files to the data grid, viewing weekly report of how many students are enrolled in that course, retrieving data, sorting the data by student name and its registration data, Besides that the user can also view weekly task in a chart. Other available features are clearly explained in the user manual section. This type of application are rapidly growing in today's context. In today's scenario most of the school have already implemented this type of method as it is simple to keep the record of all the students of students. This type of system should also be implemented in different sectors of government offices also.

2. User Manual

Here are some screenshots which will allow user to operate with the system.

When the user operates with the system the first screen will be the login screen where user should input the username and password.

A screenshot of a login screen. The background is a blue gradient. At the top center is a circular button with a silver border and a blue center, containing the word "LOGIN" in white. Below this, on a white rectangular panel, are the labels "Username:" and "Password:" in black text. Under "Username:" is a white text input field with a blue border. Under "Password:" is a white text input field with a grey border. At the bottom center of the white panel is a grey button with the word "Login" in black text.

Figure 1: Login Screen

The username and password of this system is admin. If the user input incorrect user name and password they cannot login in the system.

The image shows a login interface. At the top, there is a blue header with a circular 'LOGIN' button. Below the header, the form is white. It contains a 'Username:' label followed by a text input field containing 'admin'. Below that is a 'Password:' label followed by a password input field with five black dots. A 'Login' button is positioned below the password field. To the right of the password field, a small dialog box is open, displaying 'Login Successfull!' and an 'OK' button. The dialog box has a close button (X) in the top right corner.

Figure 2: Login details form

After the login system there is student form and different types of button where the user can input the student details.

Retrieve Data

Figure 12: Sorting by date

When the user clicks the weekly report button from the main student form following generate page appears in the screen.

Figure 13: Generate weekly report page

When the user clicks generate weekly report button the data from course enrol appears. It shows that how many students are enrolled in which subject.

The image shows the same web page as Figure 13, but now the large grey box contains a table with course enrollment data. The table has three columns: "Course Enroll", "Total Students", and an empty column. The data rows are: Computing (3), Multimedia Technologies (4), and Networks and IT Security (3).

Course Enroll	Total Students	
Computing	3	
Multimedia Technologies	4	
Networks and IT Security	3	

Figure 14: Weekly report generated

When the user clicks the chart button from the student form the chart page is generated.

Figure 15: Course Enrol Chart

3. System Architecture

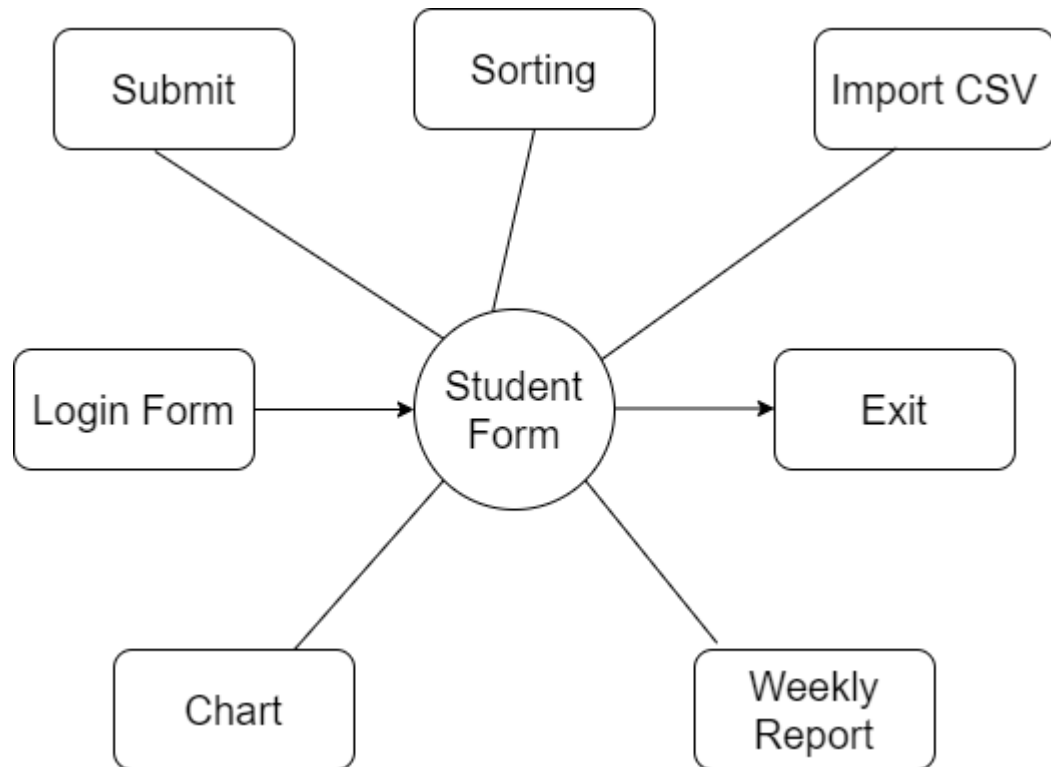

Figure 16: System Architecture Diagram

3.1 Class Diagram

A class diagram is an illustration of the relationships and source code dependencies among classes in the Unified Modelling Language (UML). In this context, a class defines the methods and variables in an object, which is a specific entity in a program or the unit of code representing that entity. Class diagrams are useful in all forms of object-oriented programming (OOP). The concept is several years old but has been refined as OOP modelling paradigms have evolved. (Rouse, 2020)

UML Class Diagram gives an overview of a software system by displaying classes, attributes, operations, and their relationships. This Diagram includes the class name, attributes, and operation in separate designated compartments. Class Diagram helps construct the code for the software application development. (guru99, 2020)

Figure 17: Class Diagram

3.2 Flow Chart

A flowchart is a formalized graphic representation of a logic sequence, work or manufacturing process, organization chart, or similar formalized structure. The purpose of a flow chart is to provide people with a common language or reference point when dealing with a project or process.

Flowcharts use simple geometric symbols and arrows to define relationships. In programming, for instance, the beginning or end of a program is represented by an oval. A process is represented by a rectangle, a decision is represented by a diamond and an I/O process is represented by a parallelogram. The Internet is represented by a cloud. (Rouse, 2020)

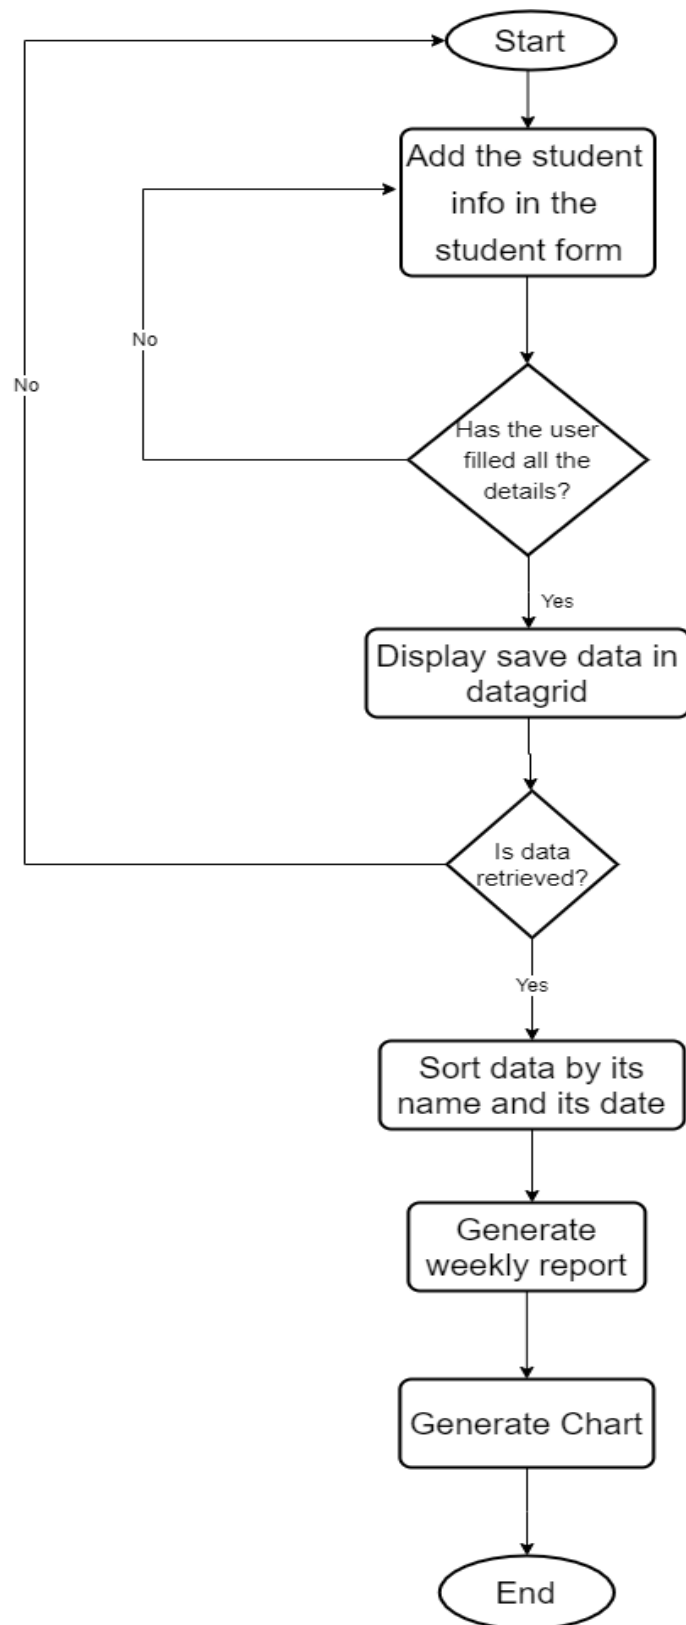

Figure 18: Flowchart Diagram

4. Sorting Algorithm

The algorithm used in our coursework is of bubble sort algorithm.

Bubble Sort is a simple algorithm which is used to sort a given set of n elements provided in form of an array with n number of elements. Bubble Sort compares all the element one by one and sort them based on their values. If the given array has to be sorted in ascending order, then bubble sort will start by comparing the first element of the array with the second element, if the first element is greater than the second element, it will swap both the elements, and then move on to compare the second and the third element, and so on. If we have total n elements, then we need to repeat this process for $n-1$ times. It is known as bubble sort, because with every complete iteration the largest element in the given array, bubbles up towards the last place or the highest index, just like a water bubble rises up to the water surface. Bubble Sorting takes place by stepping through all the elements one-by-one and comparing it with the adjacent element and swapping them if required. (studytonight, 2020)

Bubble Sort algorithm occurs in various steps. (tutorialspoint, 2020)

1. We take an unsorted array for our example. Bubble sort takes $O(n^2)$ time so we're keeping it short and precise.

2. Bubble sort starts with very first two elements, comparing them to check which one is greater.

3. In this case, value 33 is greater than 14, so it is already in sorted locations. Next, we compare 33 with 27.

4. We find that 27 is smaller than 33 and these two values must be swapped.

5. The new array should look like this.

6. Next we compare 33 and 35. We find that both are in already sorted positions.

7. Then we move to the next two values, 35 and 10.

8. We know then that 10 is smaller 35. Hence they are not sorted.

9. We swap these values. We find that we have reached the end of the array. After one iteration, the array should look like this.

10. To be precise, we are now showing how an array should look like after each iteration. After the second iteration, it should look like this.

11. Notice that after each iteration, at least one value moves at the end.

12. And when there's no swap required, bubble sort learns that an array is completely sorted.

5. Reflection

Building up a system for a student information system isn't a simple undertaking. To clarify these communication, Class Diagram dive deep into the classes and their objects and methods. This system required a long time to be build using Visual Studio 2019 using C# programming language. The framework for this system has one student form screen where we can input the details of the student. After all the planning and analysis work, the implementation of these analogies was to prepare a good user interface. After the completion of this task, I learned to make a system that keeps the record of the student from their personal record like name, address, phone number and the course they are enrolled in the time of their registration. At first when the coursework was given to us I found it a bit difficult to do but I took help from my friend and concerning lecturer. While completing this coursework I faced many problems despite that I gained a lot of knowledge about the task, which was given for me and completed the task in a given period of time.
