Module Leader

Component Grade and Comments	
<b>A. Implementation of Application</b>	
<b>User Interface and proper controls used for designing</b>	User Interface is complete but not separated and have proper use of controls
<b>Manual data entry or import from csv</b>	data types not taken care of and not properly executed functionally.
<b>Data Validation</b>	missing most of the validation
<b>Enrollment Report &amp; weekly report in tabular format</b>	very poorly executed reports and data not shown accurately
<b>Course wise enrollment report &amp; Chart display</b>	Very poorly designed and only contains one report format with in appropriate data
<b>Algorithm used for sorting &amp; proper sorting of data</b>	Sorting is implemented for not function properly
<b>B. Documentation</b>	
<b>User Manual for running the application</b>	User Manual is average. Includes description for all interfaces

<b>Application architecture &amp; description of the classes ad methods sued</b>	average work with very limited explanation of the classes and methods used
<b>Flow chart, algorithms and data sctructures used</b>	average work with very limited explanation and missing diagramatic representation.
<b>Reflective essay</b>	Average work with un clear learnings, experience or findings.

### C. Programming Style

<b>Clarity of code,Popper Naming convention &amp; comments</b>	very poorly written code and no comments at all
<b>System Usability</b>	very poorly developed application

<b>Overall Grade:</b>	<b>C</b>	<b>C</b>
-----------------------	----------	----------

### Overall Comment:

Code should be self explainable with less comments. Need some proper naming of the component and require to add comments on required area. Flaw in the process of submission of coursework.

In overall the code is working and all the functionality seems working and system can be used

Application Development

## **Abstract**

This is an individual coursework for the module “Application Development” for Student Management System which is developed using Visual Studio Platform using C# language. The coursework is released in the week 5 and it is supposed to be submitted in the week 11.

With the great contribution of Mr. Ishwor Sapkota, the coursework was completed within the time frame.

## 1. Introduction

The system designed in this project is known as Student Information System which is also designed and implemented in C# - desktop application. The main focus of this system is to keep track of the student's details, program enroll and registration date. The application allows the user to input the student personal detail including registration date so that a system can generate a weekly enrolment report of the system. The system is highly designed, developed and test under various set of conditions. In addition, there is a features to view daily or weekly table report and chart.

### 1.1 Current Scenario

There are abundance Schools/Colleges which is still capturing and storing student's record details locally where hard copies of files for every student is kept in office shelves, this seem to be tiresome and time consuming in case the registrar is looking of a particular student details or document. The problems facing the current manual system are data redundancy, difficult to update maintain, inconsistent data, insecurity, difficult to impose constraints on various data file and difficult to backup. Therefore, because of these drawbacks that Student Information System has been developed to address the problems catalogued above.

### 1.2 Proposed System

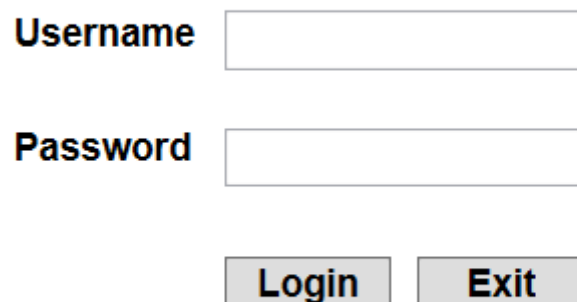

The proposed system is intended to make life easy. The main purpose of the project is to build a student information system to facilitate easy access of student's records. The Student Information System will allow the registrar of different schools/colleges, login to edit, update/view student details record, weekly report, chart and vice-versa. It also enhances efficient management of student's information.

## 2. User Manual

There are screenshot below which will illustrate a user how to operate the system.

As the end user operates the system the initial screen will be the security screen. The username and password of the system, both is “admin”. Only a valid username and password can provide access to the system. And also, if exit button is pressed then it will terminate the system.

The image shows a login screen with two input fields and two buttons. The first field is labeled 'Username' and the second is labeled 'Password'. Both fields are empty. Below the fields are two buttons: 'Login' and 'Exit'.

<b>Username</b>	<input type="text"/>
<b>Password</b>	<input type="text"/>
<input type="button" value="Login"/>	<input type="button" value="Exit"/>

*Figure 1: Login Screen*

After the successful login, the main screen of the system appears.

**Student Personal Details**

ID

Name

Address

Phone

Course Enroll

Registration Date

ID	Name	Address	Phone	Course Enroll	Registration Date	

*Figure 2: Main Screen*

The main screen provides three services: one is new entry of student details second one is to quick view of recent registered records and last one is to retrieve, chart, import CSV file, sort By date, sort by name etc.

### Student Personal Details

Figure 3: Filling new registration

After filling all the required blanks, when save button is clicked, alert box is appeared with a message data saved successfully which means our entry is registered.

When data entry is done, if we click import button then below data grid/table will display the recent registered information.

**Student Personal Details**

ID

Name

Address

Phone

Course Enroll

Registration Date

ID	Name	Address	Phone	Course Enroll	Registration Date	
5	Ishwor Sapkota	Kathmandu, Nepal	9805832714	Computing	8/2/2019	

*Figure 4: Import button function*

Clicking the import button displays the recent registered record with all the details that were filled.

The last button “Display Report” in the main window shows the following window.

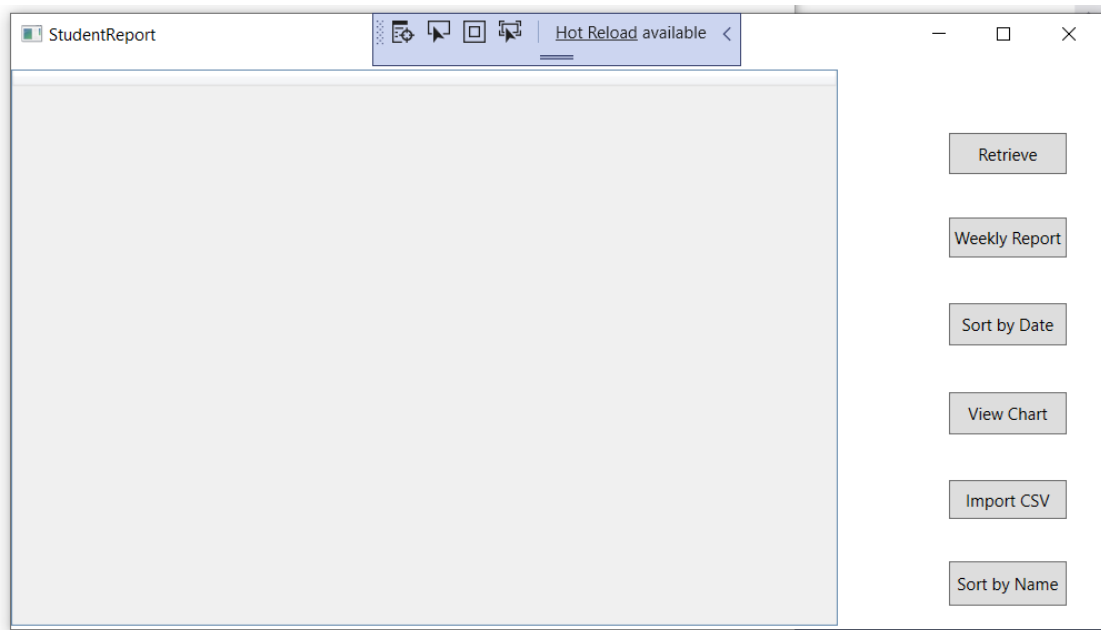

Figure 5: Display Report Window

This window shows the features button like Retrieve, Weekly Report, Sort by Date, View Chart, Import CSV and Sort by Name with data grid layout.

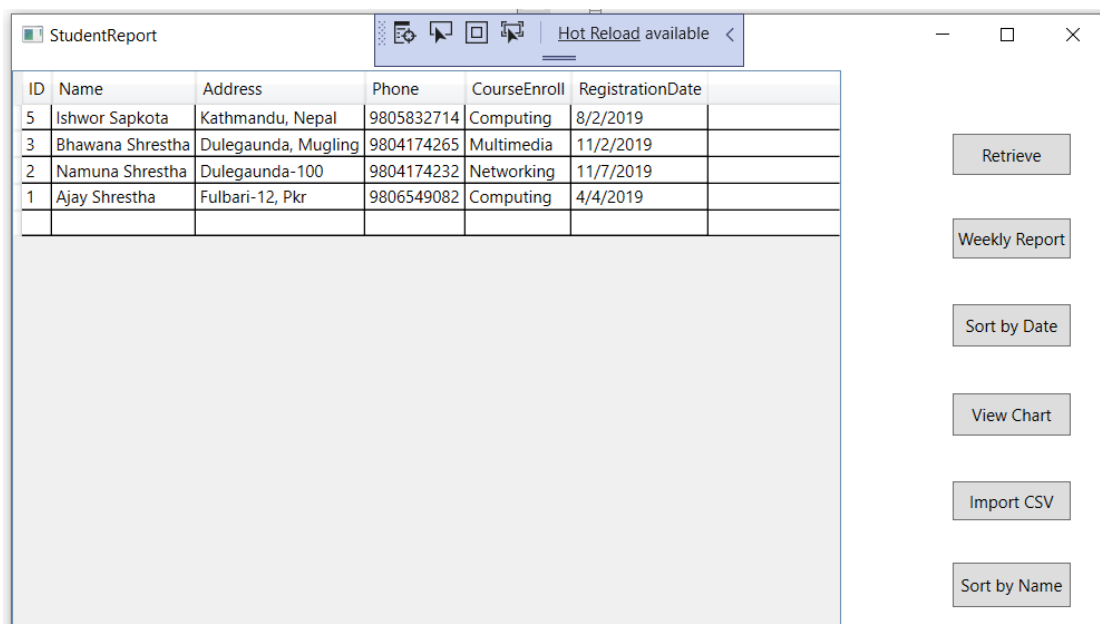

Figure 6: Retrieve function

When you press the Retrieve button, it displays the overall records inserted or registered from all time.

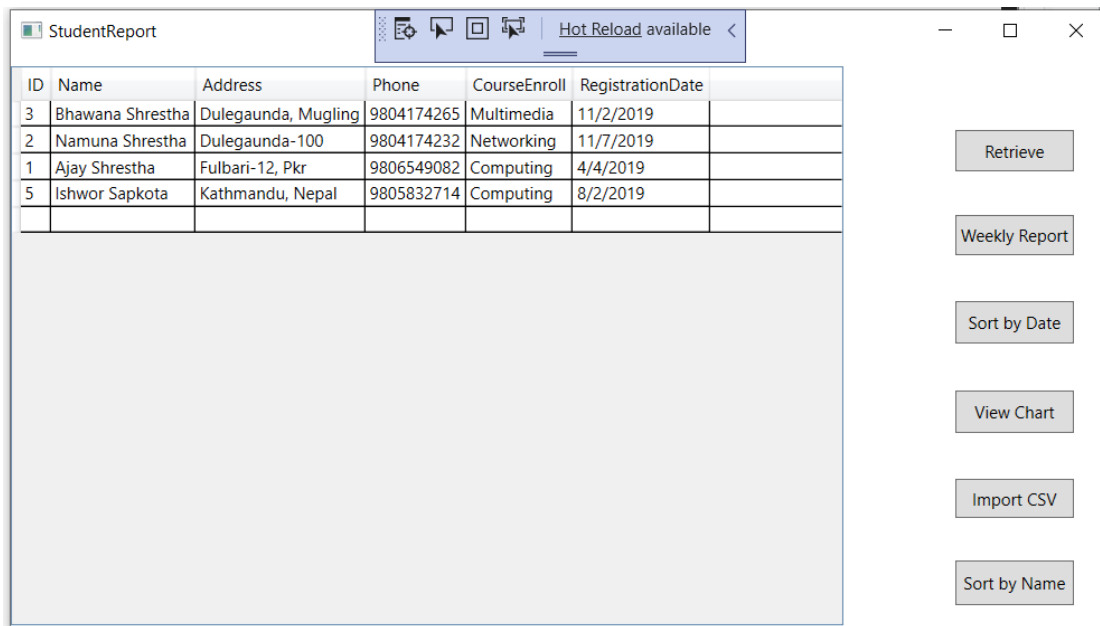

Figure 7: Weekly Report function

To see the weekly report of the student, all you have to do is close the student report window and go back to main window, press the back display report and click on weekly report button, it will show the accurate total number of students in each course enrol.

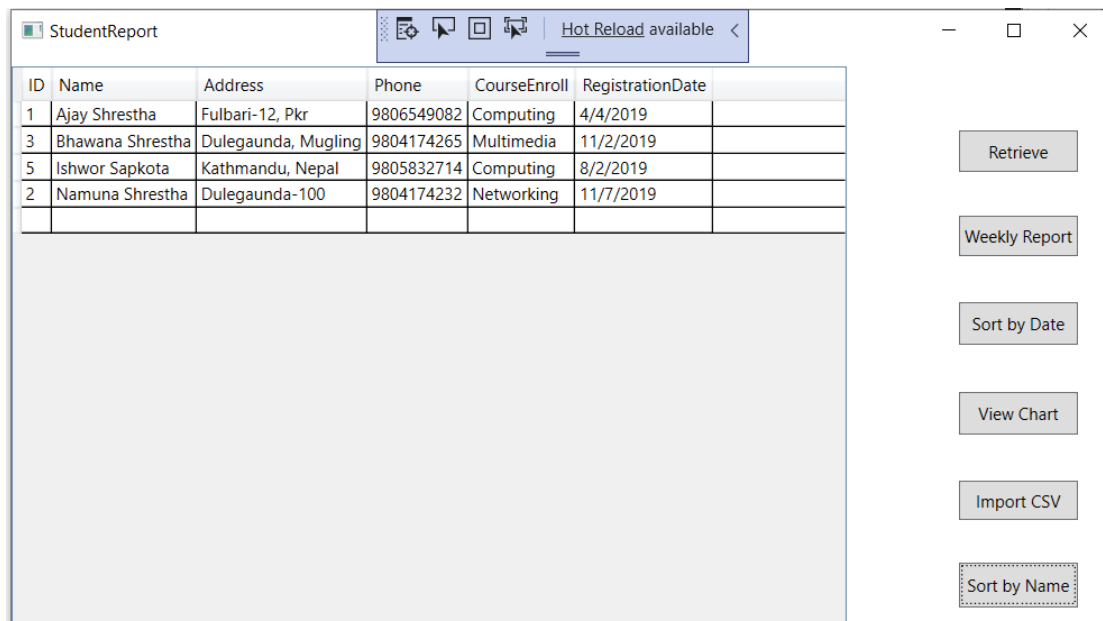

As shown in the figure 6, data are displayed in an unsorted format. So, to display in sorted format by registration date and name. A user should simply click on Sort by Date and Sort by Name as they want that list on which format.

ID	Name	Address	Phone	CourseEnroll	RegistrationDate
3	Bhawana Shrestha	Dulegaunda, Mugling	9804174265	Multimedia	11/2/2019
2	Namuna Shrestha	Dulegaunda-100	9804174232	Networking	11/7/2019

5	Ishwor Sapkota	Kathmandu, Nepal	9805832714	Computing	8/2/2019

Figure 8: Sort by Date Format

As the user click on Sort by Date button, all the details will be refreshed and it will sorted according to registration date.

ID	Name	Address	Phone	CourseEnroll	RegistrationDate
1	Ajay Shrestha	Fulbari-12, Pkr	9806549082	Computing	4/4/2019
3	Bhawana Shrestha	Dulegaunda, Mugling	9804174265	Multimedia	11/2/2019
5	Ishwor Sapkota	Kathmandu, Nepal	9805832714	Computing	8/2/2019
2	Namuna Shrestha	Dulegaunda-100	9804174232	Networking	11/7/2019

Figure 9: Sort by Name Format

As the user click on Sort by Date button, all the details will be refreshed and it will sorted according to name basis.

To view the detail in a chart section, a user should simply click on View Chart and following screen will appear.

Figure 10: Chart Display of Report

A user can import the data from a CSV file into the grid as shown below.

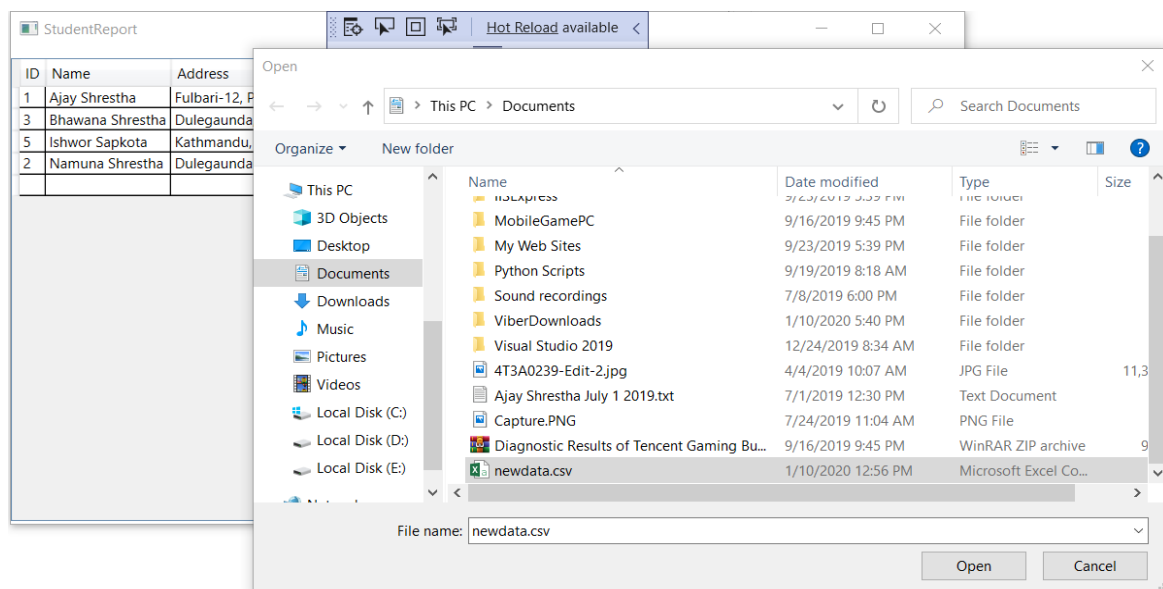

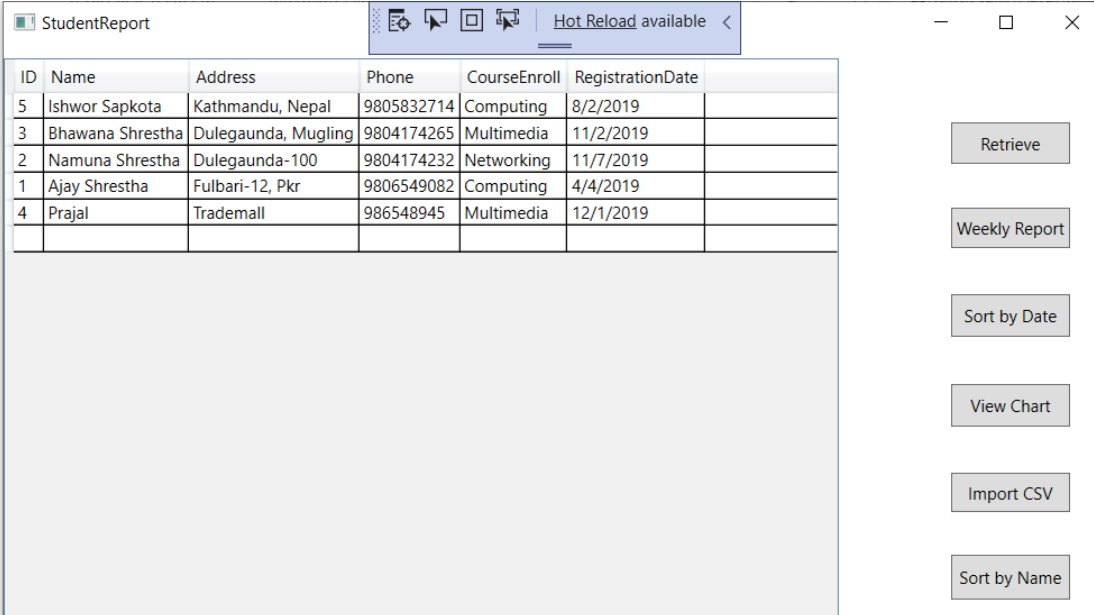

Figure 11: Import data from CSV

The data will be displayed in the grid as shown below. The last row has been added to the grid from CSV file.

The screenshot shows a web application window titled "StudentReport". The window has a toolbar with icons for settings, zoom, and a "Hot Reload available" button. Below the toolbar is a data grid with 7 columns: ID, Name, Address, Phone, CourseEnroll, RegistrationDate, and an empty column. The grid contains 6 rows of data. To the right of the grid is a sidebar with six buttons: Retrieve, Weekly Report, Sort by Date, View Chart, Import CSV, and Sort by Name.

ID	Name	Address	Phone	CourseEnroll	RegistrationDate

### 3. Journal Articles

- a. A new type of student information management system is designed to implement student information identification and management based on fingerprint identification. In order to ensure the security of data transmission, this paper proposes a data encryption method based on an improved AES algorithm. A new -box is cleverly designed, which can significantly reduce the encryption time by improving ByteSub, ShiftRow, and MixColumn in the round transformation of the traditional AES algorithm with the process of look-up table. Experimental results show that the proposed algorithm can significantly improve the encryption time compared with the traditional AES algorithm (Pengtao Yang, 2017).
- b. The management and provision of information about the educational process is an essential part of effective management of the educational process in the institutes of higher education. In this paper the requirements of a reliable student management system are analyzed, formed a use-case model of student information management system, designed and implemented the architecture of the application. Regarding the implementation process, modern approaches were used to develop and deploy a reliable online application in cloud computing environments specifically (Alameri, 2017).
- c. The mission of the Student Information Management system is to create an integrated information technology environment for students, HOD, faculty, staff and administration. Our goal is to focus on services and integration for end users. It is a web based self service environment for students, prospective students, and employees; an administrative transaction processing environment for yearly admissions; an informative environment for all levels of faculty and staff to do reporting, data extraction and information analysis. It is mainly useful for educational establishments to manage student data which also facilitates all individual associated information for easier navigation on daily basis. It provides capabilities for entering student test and other assessment scores, building student schedules, tracking student attendance and managing many other student-related data needs in a

college. Our easy-to-use, integrated college administration application would be used to reduce time spent on administrative tasks, as to concentrate on other skillful practical activities other than book worming. It can accept, process and generate reports at any given point of time accurately (Dipin Budhrani, 2018).

- d. The study aimed to assess the contribution of Student Management Teams (SMTs) in a large undergraduate class and identify barriers and facilitators of the communication process and learning experience. SMTs were put into practice supported by an Online Learning Management System (OLMS: easyclass). It was hypothesized that students would positively evaluate their team participation, its role to the communication process and learning experience and there would be positive associations between the LMS, communication and learning experience. The results confirmed the hypotheses showing the effectiveness of SMTs, highlighting the use of OLMS and confirming the relationship between communications and learning experience satisfaction, also supported by qualitative data (Petkari, 2015).

Figure 18: Chart Individual Diagram

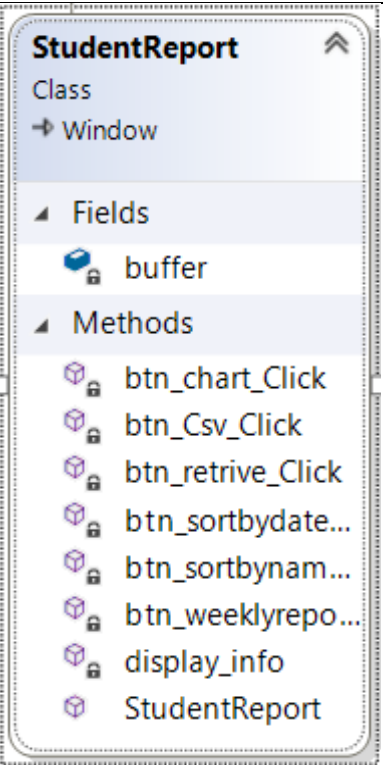

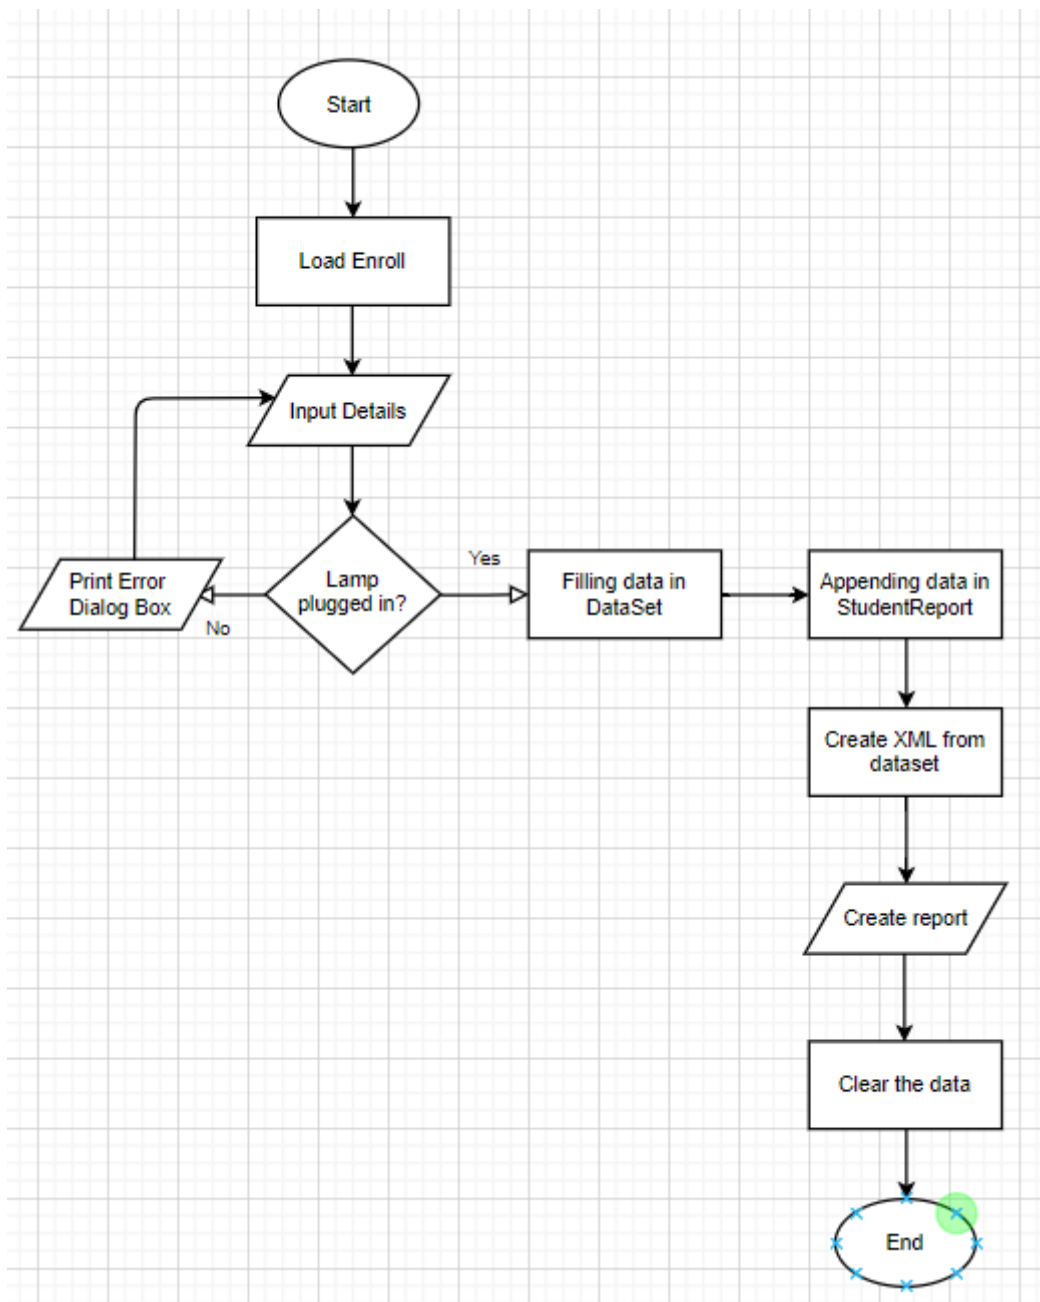

Methods	Description	Diagram
btn_chart_click	Displays chart of the report.	 <pre> classDiagram     class StudentReport {         +Class         +Window         +Fields         +Methods     }     class Fields {         +buffer     }     class Methods {         +btn_chart_Click         +btn_Csv_Click         +btn_retrieve_Click         +btn_sortbydate...         +btn_sortbyname...         +btn_weeklyrepo...         +display_info     } </pre> <p>The diagram shows a class named <b>StudentReport</b>. It has a <b>Class</b> attribute and a <b>Window</b> attribute. It contains a <b>Fields</b> section with a <b>buffer</b> field. It also contains a <b>Methods</b> section with the following methods: <b>btn_chart_Click</b>, <b>btn_Csv_Click</b>, <b>btn_retrieve_Click</b>, <b>btn_sortbydate...</b>, <b>btn_sortbyname...</b>, <b>btn_weeklyrepo...</b>, <b>display_info</b>, and <b>StudentReport</b>.</p>
btn_Csv_Click	Import csv file to the current report.	
btn_retrieve_Click	Retrieve the data inserted in the registration form.	
btn_sortbydate_Click	Sort the registration date of the report in ascending order.	
btn_sortbyname_Click	Sort the name of the report in ascending order.	
btn_weeklyreport_Click	Displays the weekly report of the data in grid.	

Figure 19: Student Report Individual Diagram

## Flowchart for Reports

*Figure 20: Flowchart of Enrol Students*

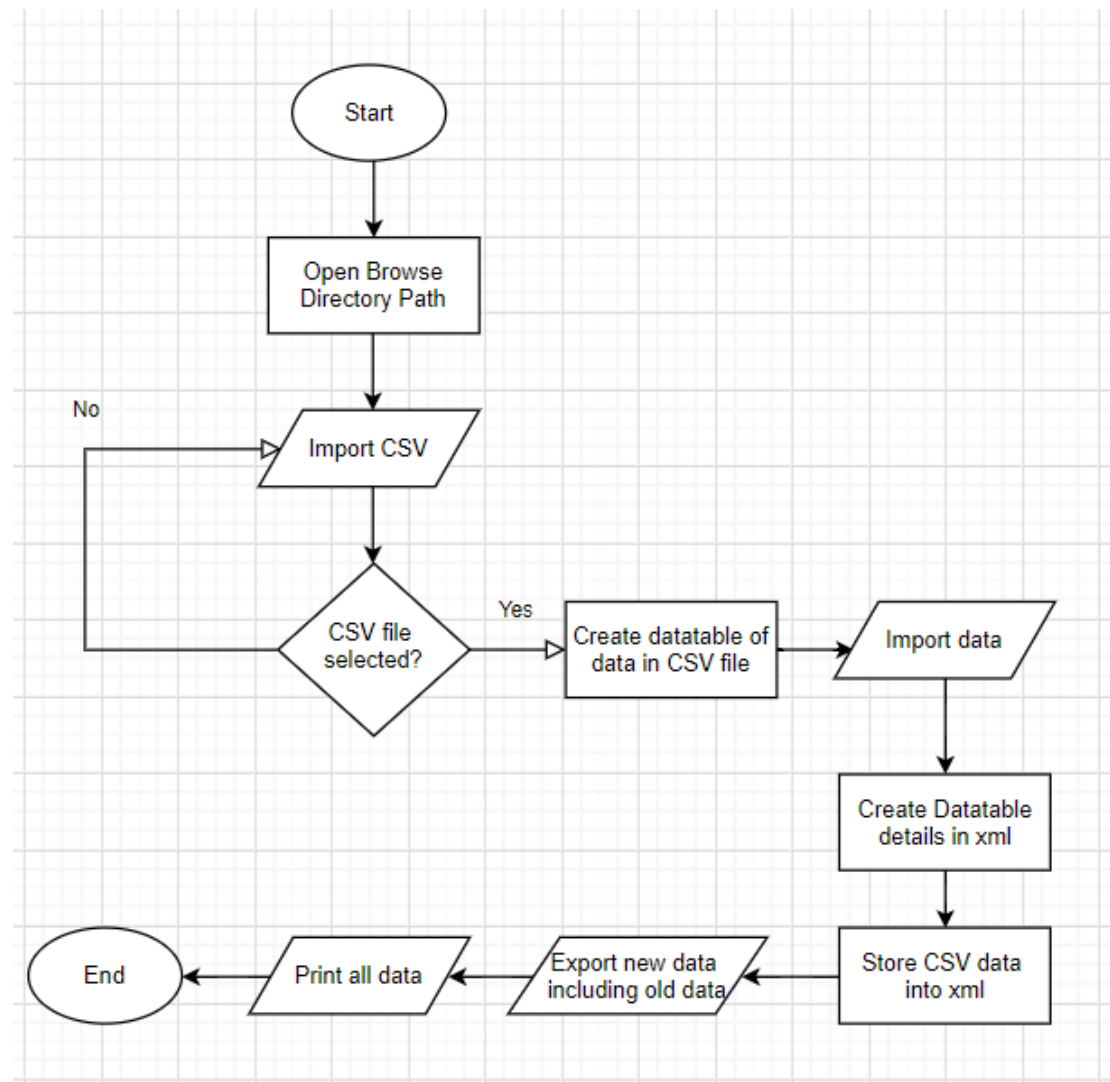

Figure 21: Import CSV flowchart

## 5. Sorting Algorithm

The sorting Algorithm used in Student Information System is bubble sorting algorithm.

Bubble Sort is a simple algorithm which is used to sort a given set of  $n$  elements provided in form of an array with  $n$  number of elements. Bubble Sort compares all the element one by one and sort them based on their values (Anon., 2020).

If the given array has to be sorted in ascending order, then bubble sort will start by comparing the first element of the array with the second element, if the first element is greater than the second element, it will swap both the elements, and then move on to compare the second and the third element, and so on.

If we have total  $n$  elements, then we need to repeat this process for  $n-1$  times.

It is known as bubble sort, because with every complete iteration the largest element in the given array, bubbles up towards the last place or the highest index, just like a water bubble rises up to the water surface.

Sorting takes place by stepping through all the elements one-by-one and comparing it with the adjacent element and swapping them if required.

### Implementing Bubble Sort Algorithm

Following are the steps involved in bubble sort (for sorting a given array in ascending order):

1. Starting with the first element (index = 0), compare the current element with the next element of the array.
2. If the current element is greater than the next element of the array, swap them.
3. If the current element is less than the next element, move to the next element. Repeat Step 1.

Let's consider an array with values {5, 1, 6, 2, 4, 3}

Below, we have a pictorial representation of how bubble sort will sort the given array.

So as we can see in the representation above, after the first iteration, 6 is placed at the last index, which is the correct position for it.

Similarly after the second iteration, 5 will be at the second last index, and so on (Anon., 2020).

## 6. Reflection

The developed system is Student Information System. Student Information System is a comprehensive University Student Administration System, enabling any academic or educational organization to capture, maintain, update and provide accurate personal and academic information about all current and past students with any University. The system has modules that help accurately maintain Enrol, records and registration date.

The features of adding the new record through online and CSV file has the outstanding flexibility and performance to maintain the records. Accuracy of report showing with sorted listing the table inquiries and graphical chart and also the weekly report.

My experience is fairly exclusive with Visual Studio, in that it's the only IDE I've ever properly used. I came to know deeply and professionally with the language so far. Accuracy, less time consuming, flexibility etc. were found in this application. Features like creating chart, generating list in grid view. Additionally, sorting of data from the grid was a new achievement for me. Furthermore, import and exporting to CSV file was new and overall evaluation with the great support of Mr. Ishwor Sapkota. The coursework has come to an end.

## 7. Conclusion

For module CS6004NP Application Development, the initial coursework was to design and implement Student Information System in C# - desktop application (not a web-based or database application) for a company. It took a long time to build up the task in Visual Studio 2019 utilizing the required programming dialect. The framework has login screen to add security to the system. After login, the framework shows a primary screen where every functionalities is done. Aside from various shape components, class outline for every structures and classes were utilized.

And finally the coursework has been completed.
