1. Introduction

This course work is about Student Information System where you can enrol different students and can choose different courses to enrol. You can generate report of all details and can look at number of students in each course. There is also a chart that shows the details of the student.

This course work is done in Visual Studio using C#. This project is based on WPF(Windows Presentation Foundation).

Visual Studio is an Integrated Development Environment(IDE) developed by Microsoft to develop GUI(Graphical User Interface), console, Web applications, web apps, mobile apps, cloud, and web services, etc. With the help of this IDE, you can create managed code as well as native code. It uses the various platforms of Microsoft software development software like Windows store, Microsoft Silverlight, and Windows API, etc. It is not a language-specific IDE as you can use this to write code in C#, C++, VB(Visual Basic), Python, JavaScript, and many more languages. It provides support for 36 different programming languages. It is available for Windows as well as for macOS (Anon., n.d.).

Windows Presentation Foundation(WPF) is a development framework used to create a desktop application. It is a part of the .NET framework. The WPF has a resolution-independent and vector-based rendering engine which is helpful to deal with modern graphics hardware. The latest version of WPF is 4.6. In this framework, UI of the application is designed in XAML language and Application logic is Written in C# programming language (Anon., n.d.).

2. User Manual

Figure 1 Login

This is the first window that appears after we run the code. This is the login form where the user enters the username and the password to login. After you are logged in, you will see the main window appear.

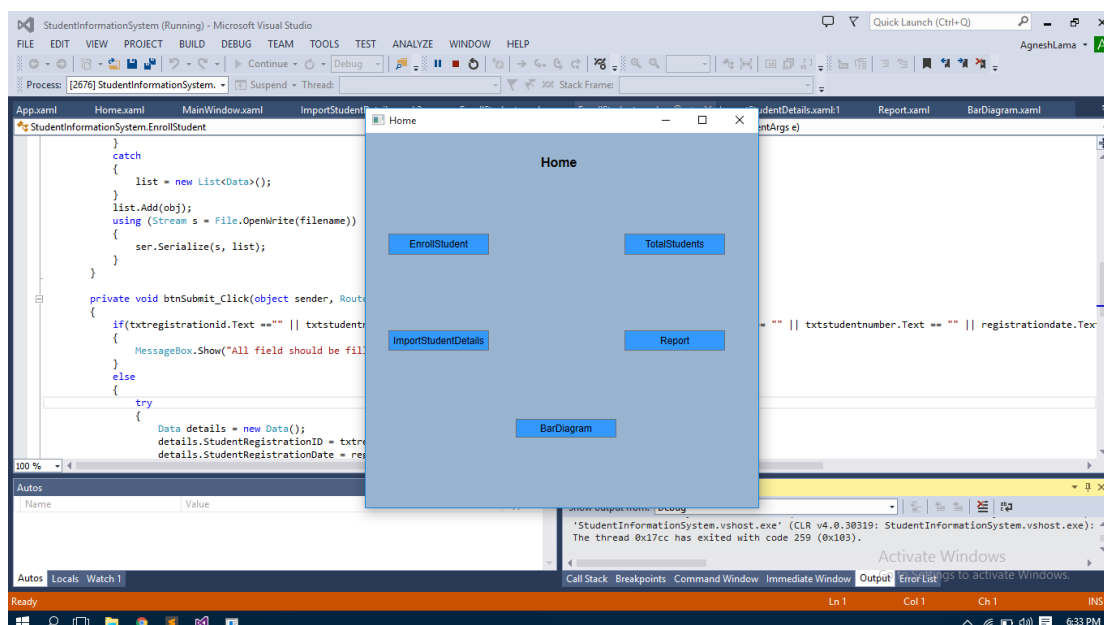

Figure 2 MainWindow

This is the main window of the project. From this window you can go to all the other windows and do as the user wants.

Figure 3 Student Details

In this window you can enroll the student by filling all the fields and clicking on the submit button. After you click on the submit button, a dialog box will appear that will have some message written to show that the student is enrolled successfully.

Figure 4 Import Student Details

In this window, if the user wants to import student details from CSV file, they can import that file by clicking on the import button. Or user can go back into the main page by clicking on the home button.

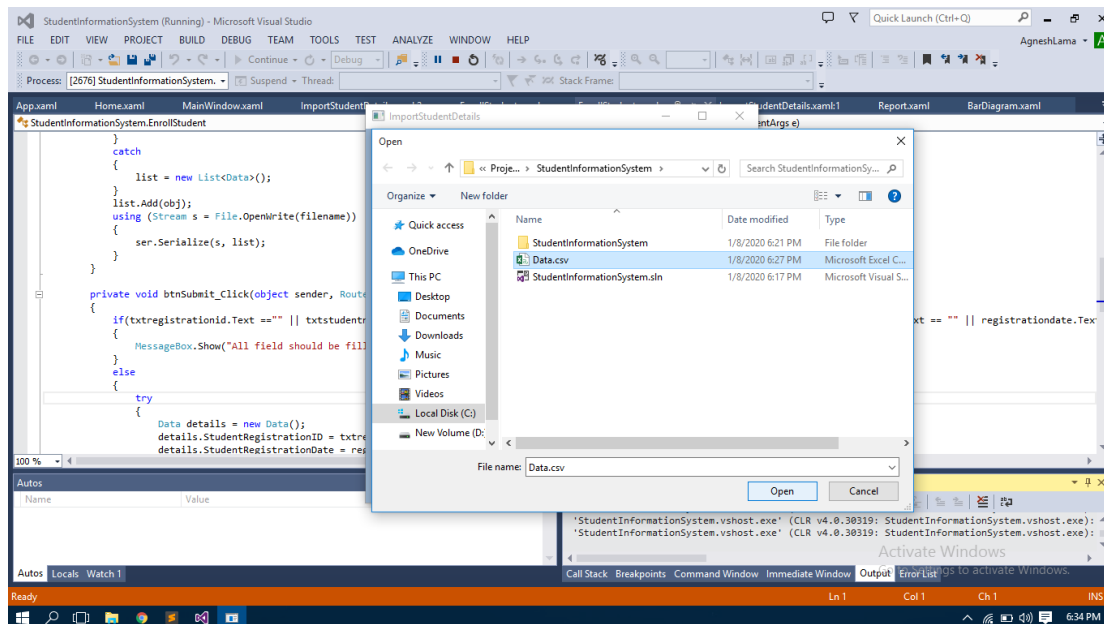

Figure 5 Import CSV file

This shows how CSV file is imported into the project. Once you choose the required CSV file, you click on open and then the file will be imported.

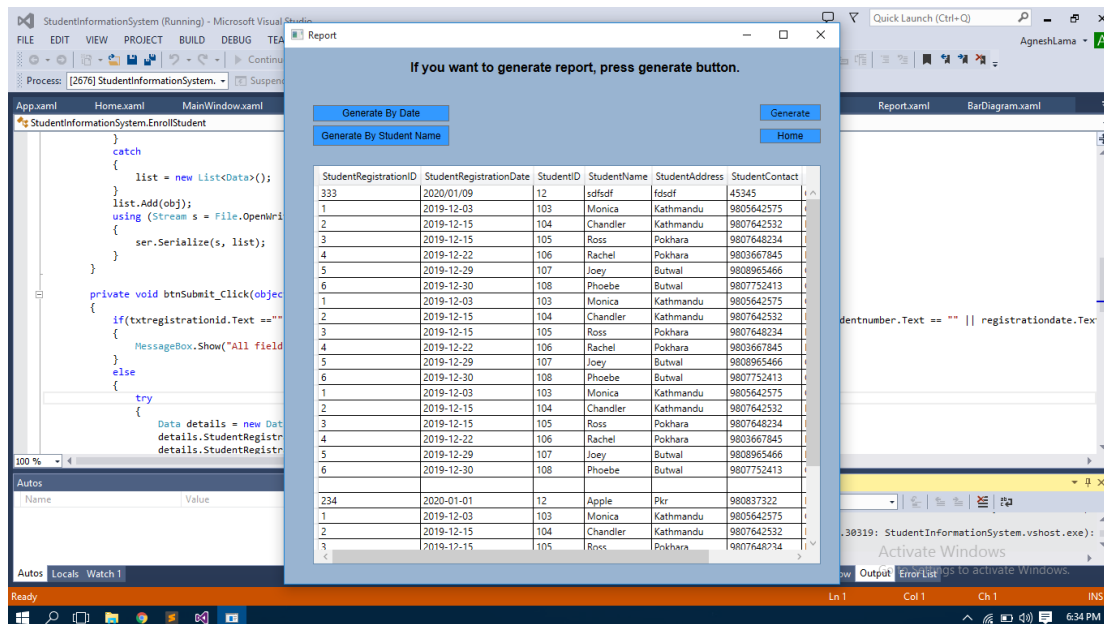

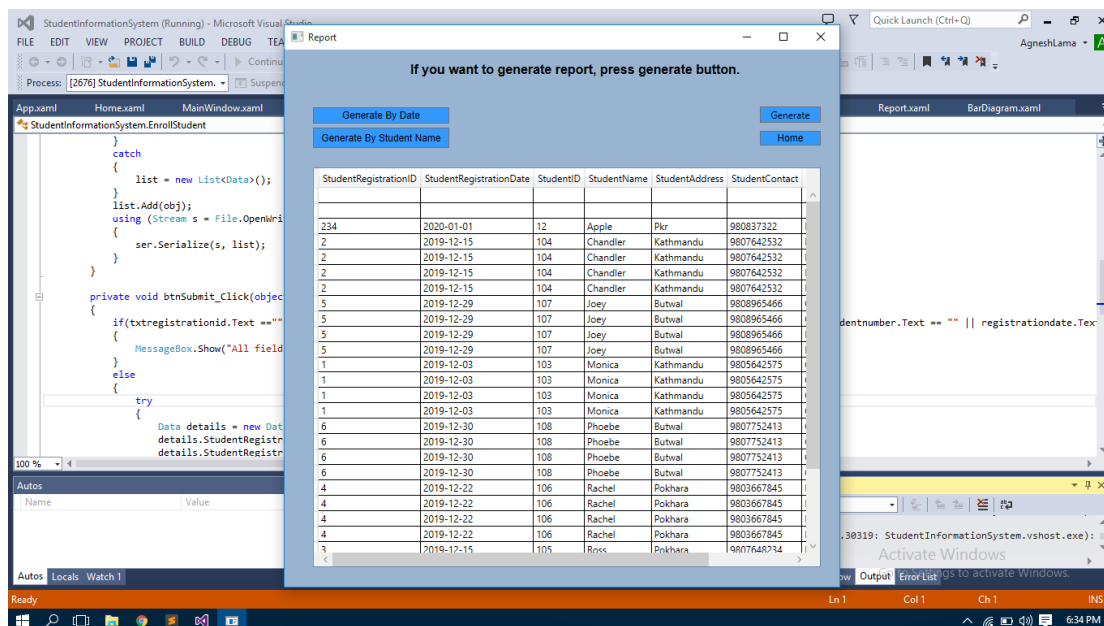

Figure 6 Total Students

This is the windows which shows total number of students enrolled in each course. User can look at this information once the user clicks on the show button on the screen. And can go back to the main page by clicking on home button.

This is the window that shows report of all the students enrolled. This information is showed once the user clicks on generate button.

When the report is generated, all the information showed is not in order. You can sort them by pressing on generate by name button if user want to sort by alphabetical order.

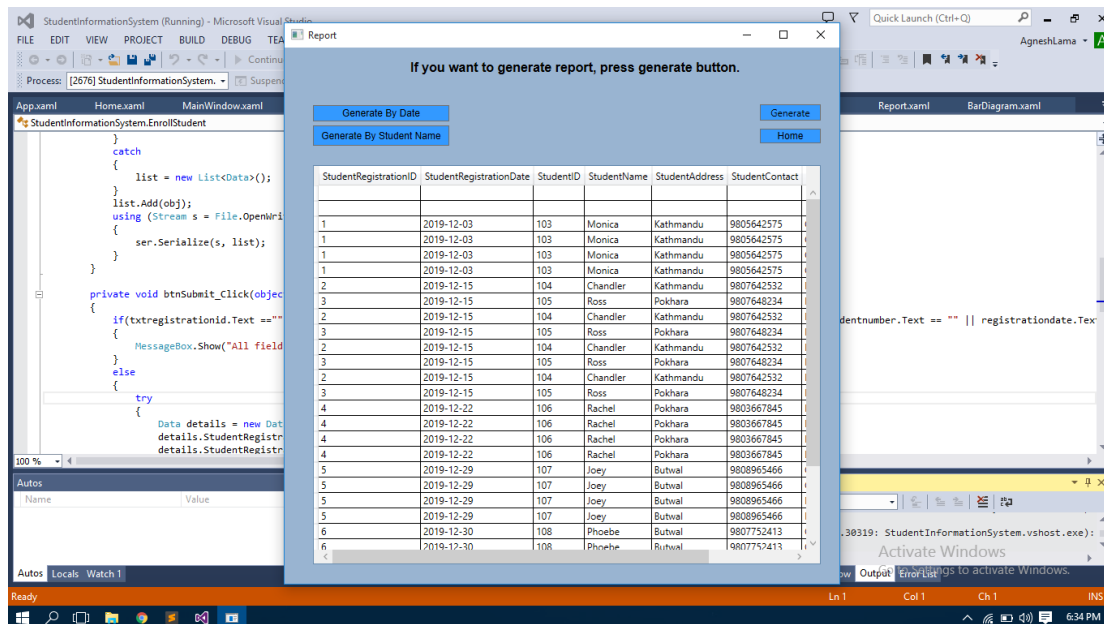

Figure 9 Sort By Date

If user wants to generate report by date then you can click on generate by date button. And if you want to go back you can press home button.

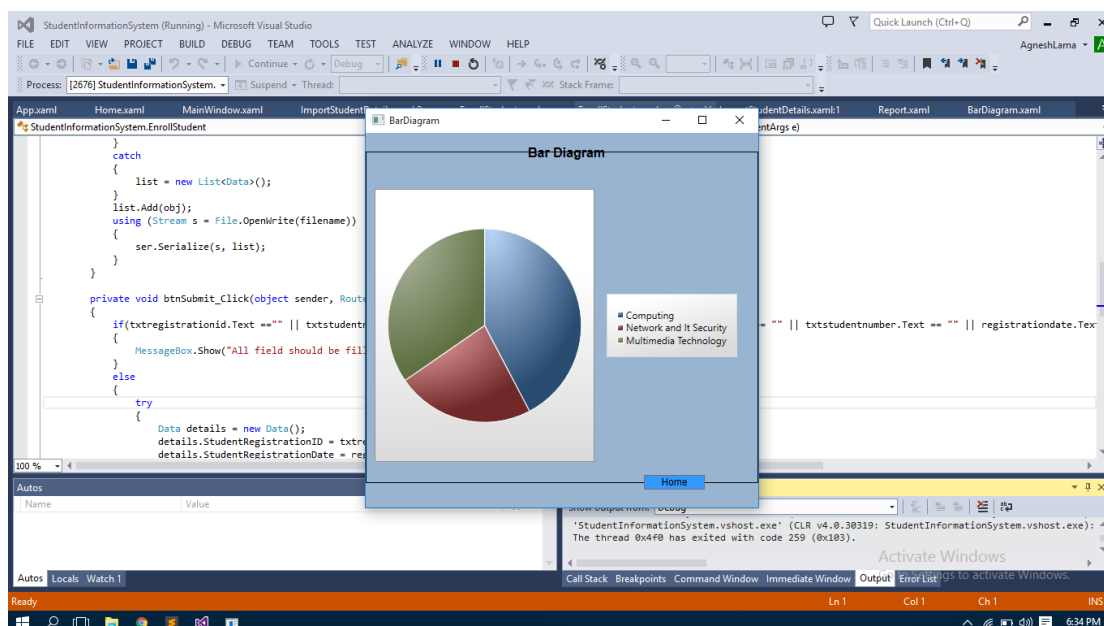

Figure 10 Chart

This is pie chart of all the student details.

3. Journal Articles

These are the few journals I went through to help me finish my coursework. All these journals are based on Student Information System which is similar to our coursework. I got some ideas after reading these journals on how these types of system help in managing student's details and data.

Abstract

Over the past few decades, universities all over the world have been experiencing new paradigms in the way they handle and manage students' information due to the proliferation of ICTs and its applications such as web-based student information systems. With the adoption of such systems as the Online Student Information System (OSIS) in academic institutions, the experience is that it has now become easy to harness and fast track all students' records in one centralized database via the internet technology. While the benefits of OSIS seem to be celebrated, it has been a hustle for most universities in Africa to completely go digital in their operations due poor ICT infrastructures that seem to be prevalent in the region. In Malawi, a social survey was conducted with the aim of assessing the Mzuzu University Student Online Management System (SOMS) from the perspective of students. The study applied the principles of both qualitative and quantitative research approaches. The principal data collection methods were questionnaires and follow up interviews. The study population was made up of third year students in the Faculty of Information Science and Communications and the Director of ICT services at Mzuzu University. The quantitative data collected were analysed and presented using Microsoft Excel Package. Thematic analysis technique was used to analyse the data collected through interviews. The study revealed that Mzuzu University SOMS has one prime service which is online registration and admissions, with online examination results access, student profile and finance as add-ons. The system benefits students as it has cut the time spent during registration periods in every new semester. Students faced the following major challenges when using the system; server loads as more students

Abstract

A new type of student information management system is designed to implement student information identification and management based on fingerprint identification. In order to ensure the security of data transmission, this paper proposes a data encryption method based on an improved AES algorithm. A new S-box is cleverly designed, which can significantly reduce the encryption time by improving ByteSub, ShiftRow, and MixColumn in the round transformation of the traditional AES algorithm with the process of look-up table. Experimental results show that the proposed algorithm can significantly improve the encryption time compared with the traditional AES algorithm.

4. System Architecture

4.1 Class Diagram

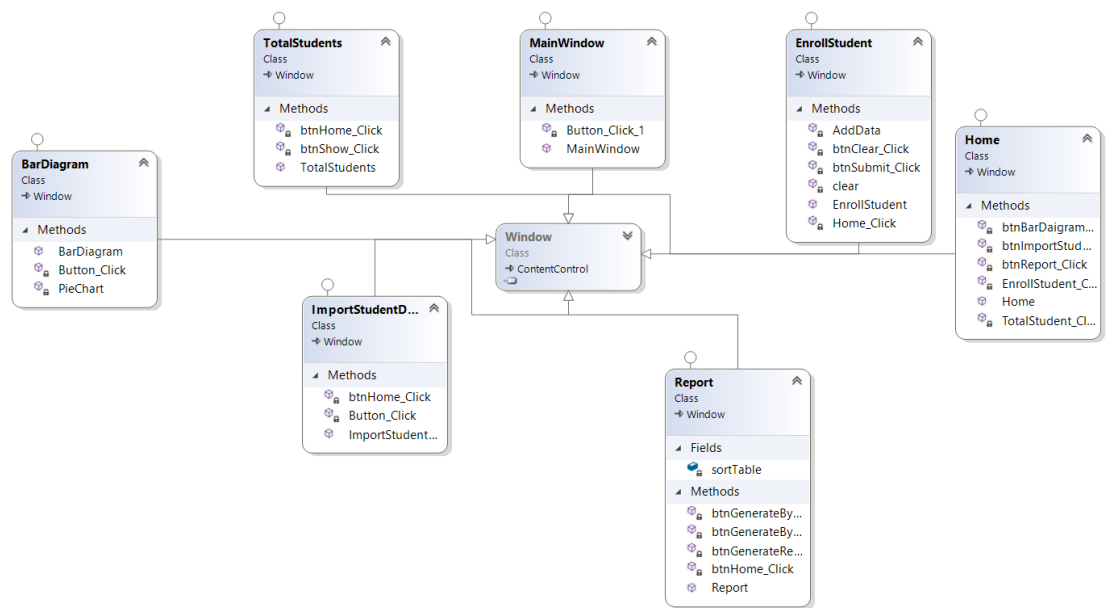

Figure 14 Class Diagram

This is the main class diagram which shows all the classes used in the project. There are total of seven main classes. They are: TotalStudents, MainWindow, EnrollStudent, Home, BarDiagram, ImportStudentDetails, Report.

Methods	Description	Figure
Button_Click_1	The Button_Click_1 method deals with all the action which is done when clicking on that button.	

Table 1 MainWindow

Methods	Description	Figure
-Button_Click_1 -PieChart	- The Button_Click_1 method deals with all the action which is done when clicking on that button. - The PieChart method shows the chart for the report.	

Table 2 BarDiagram

Methods	Description	Figure
-AddData -btnClear_Click -btnSubmit_Click -clear -EnrollStudent -Home_Click	- AddData method adds data into the file. - btnClear_Click method clears the data written in the form for further use. - btnSubmit_Click method submits the data entered by the user. - EnrollStudent method tells if the student is enrolled successfully or not. - Home_Click method takes you back into home page.	

Table 3 EnrollStudent

Methods	Description	Figure
-btnBar_Diagram -btnImportStudent -btnReport_Click -Home - -EnrollStudent_Click -TotalStudent_Click	- btnBar_Diagram takes you to bar diagram window. - btnImportStudent takes you to import student window. - btnReport_Click takes you to report window. -EnrollStudent_Click takes you to enroll window. - TotalStudent_Click takes you to total student window.	 <p>The figure shows a UML Class Diagram for the 'Home' class. It is a 'Class' and a 'Window'. The 'Methods' section lists: btnBarDaigram..., btnImportStud..., btnReport_Click, EnrollStudent_C..., Home, and TotalStudent_Cl... Each method is preceded by a small icon representing a button.</p>

Table 4 Home

Methods	Description	Figure
-btnGenerateByDate - -btnGenerateByName -btnGenerateReport -btnHome_Click -Report	- btnGenerateByDate generates report in order of date. - btnGenerateByName generates report in alphabetical order. - btnGenerateReport generates report of all the student. -btnHome_Click takes you back to home page.	 <p>The figure shows a UML Class Diagram for the 'Report' class. It is a 'Class' and a 'Window'. The 'Fields' section lists: sortTable. The 'Methods' section lists: btnGenerateBy..., btnGenerateBy..., btnGenerateRe..., btnHome_Click, and Report. Each method is preceded by a small icon representing a button.</p>

Table 5 Report

Methods	Description	Figure
- ImportStudentDetails_Click -btnHome_Click -Button_Click	- ImportStudentDetails_Click imports CVS file. -btnHome_Click takes you back to home page.	 <p>The figure shows a UML Class Diagram for the ImportStudentDetails class. The class is labeled as a Class and has a Window icon. It contains three methods: btnHome_Click, Button_Click, and ImportStudent.... Each method is preceded by a small icon representing a button click.</p>

Table 6 ImportStudentDetails

Methods	Description	Figure
-btnHome_Click -btnShow_Click -TotalStudents	-btnShow_Click shows total number of students on each course. -btnHome_Click takes you back to home page.	 <p>The figure shows a UML Class Diagram for the TotalStudents class. The class is labeled as a Class and has a Window icon. It contains three methods: btnHome_Click, btnShow_Click, and TotalStudents. Each method is preceded by a small icon representing a button click.</p>

Table 7 TotalStudent

4.2 Flow Chart

Figure 15 Enroll student flowchart

Figure 16 CSV file flowchart

5. Sorting Algorithm

Bubble Sort:

Bubble Sort is the simplest sorting algorithm that works by repeatedly swapping the adjacent elements if they are in wrong order.

Example:

First Pass:

(5 1 4 2 8) \rightarrow (1 5 4 2 8), Here, algorithm compares the first two elements, and swaps since $5 > 1$.

(1 5 4 2 8) \rightarrow (1 4 5 2 8), Swap since $5 > 4$

(1 4 5 2 8) \rightarrow (1 4 2 5 8), Swap since $5 > 2$

(1 4 2 5 8) \rightarrow (1 4 2 5 8), Now, since these elements are already in order ($8 > 5$), algorithm does not swap them.

Second Pass:

(1 4 2 5 8) \rightarrow (1 4 2 5 8)

(1 4 2 5 8) \rightarrow (1 2 4 5 8), Swap since $4 > 2$

(1 2 4 5 8) \rightarrow (1 2 4 5 8)

(1 2 4 5 8) \rightarrow (1 2 4 5 8)

Now, the array is already sorted, but our algorithm does not know if it is completed. The algorithm needs one whole pass without any swap to know it is sorted.

Third Pass:

(1 2 4 5 8) \rightarrow (1 2 4 5 8)

(1 2 4 5 8) \rightarrow (1 2 4 5 8)

(1 2 4 5 8) \rightarrow (1 2 4 5 8)

(1 2 4 5 8) \rightarrow (1 2 4 5 8) (Anon., n.d.)

6. Conclusion

This course work taught me a lot about C# and how to use Visual Studio. I got to learn many new things while doing this course work. I had to do a lot of research for this course work to be completed. I went through many articles and websites. I also watched a lot of videos on YouTube to learn to do this course work. Though it was difficult at first, I was able to complete this coursework on time. This kind of system should be more implemented on daily basis because it is very useful and is very easy and less time consuming to do your task. These kinds of system may be a great help in schools and colleges to store data of their students.
